- **Chapter 34**, “Error Messages,” starting on page 759, lists the instrument error messages that can occur while programming the oscilloscope.

The command descriptions in this reference show upper and lowercase characters. For example, :AUToscale indicates that the entire command name is :AUTOSCALE. The short form, :AUT, is also accepted by the oscilloscope.

Then, there are chapters that describe programming topics and conceptual information in more detail:

- **Chapter 35**, “Status Reporting,” starting on page 767, describes the oscilloscope’s status registers and how to check the status of the instrument.
- **Chapter 36**, “Synchronizing Acquisitions,” starting on page 787, describes how to wait for acquisitions to complete before querying measurement results or performing other operations with the captured data.
- **Chapter 37**, “More About Oscilloscope Commands,” starting on page 797, contains additional information about oscilloscope programming commands.

Finally, there is a chapter that contains programming examples:

- **Chapter 38**, “Programming Examples,” starting on page 807.

Mixed-Signal Oscilloscope Channel Differences	Because both the “analog channels only” oscilloscopes (DSO models) and the mixed-signal oscilloscopes (MSO models) have analog channels, topics that describe analog channels refer to all oscilloscope models. Whenever a topic describes digital channels, that information applies only to the mixed-signal oscilloscope models.

Version 1.00 at Introduction

The Keysight InfiniiVision 2000 X-Series oscilloscopes were introduced with version 1.00 of oscilloscope operating software.

The command set is most closely related to the InfiniiVision 7000B Series oscilloscopes (and the 7000A Series, 6000 Series, and 54620/54640 Series oscilloscopes before them). For more information, see "["Command Differences From 7000B Series Oscilloscopes"](#) on page 37.

Command Differences From 7000B Series Oscilloscopes

The Keysight InfiniiVision 2000 X-Series oscilloscopes command set is most closely related to the InfiniiVision 7000B Series oscilloscopes (and the 7000A Series, 6000 Series, and 54620/54640 Series oscilloscopes before them).

The main differences between the version 1.00 programming command set for the InfiniiVision 2000 X-Series oscilloscopes and the 6.10 programming command set for the InfiniiVision 7000B Series oscilloscopes are related to:

- Built-in waveform generator (with Option WGN license).
- Built-in demo signals (with Option EDU license that comes with the N6455A Education Kit).
- Reference waveforms (in place of trace memory).
- Serial decode is not supported.
- Waveform event search is not supported.
- Smaller set of trigger types.
- Fewer measurements.
- Different path name format for internal and USB storage device locations.

More detailed descriptions of the new, changed, obsolete, and discontinued commands appear below.

2 Setting Up

Step 1. Install Keysight IO Libraries Suite software / 42

Step 2. Connect and set up the oscilloscope / 43

Step 3. Verify the oscilloscope connection / 45

This chapter explains how to install the Keysight IO Libraries Suite software, connect the oscilloscope to the controller PC, set up the oscilloscope, and verify the oscilloscope connection.

Step 1. Install Keysight IO Libraries Suite software

- 1** Download the Keysight IO Libraries Suite software from the Keysight web site at:
 - <http://www.keysight.com/find/iolib>
- 2** Run the setup file, and follow its installation instructions.

Step 2. Connect and set up the oscilloscope

The 2000 X-Series oscilloscope has three different interfaces you can use for programming:

- USB (device port).
- LAN, when the LAN/VGA option module is installed. To configure the LAN interface, press the **[Utility]** key on the front panel, then press the **I/O** softkey, then press the **Configure** softkey.
- GPIB, when the GPIB option module is installed.

When installed, these interfaces are always active.

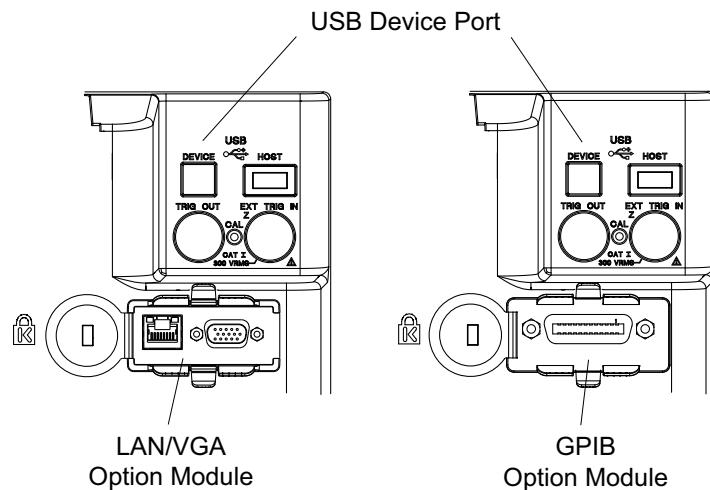

Figure 1 Control Connectors on Rear Panel

Using the USB (Device) Interface

- 1 Connect a USB cable from the controller PC's USB port to the "USB DEVICE" port on the back of the oscilloscope.

This is a USB 2.0 high-speed port.

Using the LAN Interface

- 1 If the controller PC is not already connected to the local area network (LAN), do that first.
- 2 Contact your network administrator about adding the oscilloscope to the network.

Find out if automatic configuration via DHCP or AutoIP can be used. Also, find out whether your network supports Dynamic DNS or Multicast DNS.

If automatic configuration is not supported, get the oscilloscope's network parameters (hostname, domain, IP address, subnet mask, gateway IP, DNS IP, etc.).

- 3 Connect the oscilloscope to the local area network (LAN) by inserting LAN cable into the "LAN" port on the LAN/VGA option module.
- 4 Configure the oscilloscope's LAN interface:
 - a Press the **Configure** softkey until "LAN" is selected.
 - b Press the **LAN Settings** softkey.
 - c Press the **Config** softkey, and enable all the configuration options supported by your network.
 - d If automatic configuration is not supported, press the **Addresses** softkey.

Use the **Modify** softkey (and the other softkeys and the Entry knob) to enter the IP Address, Subnet Mask, Gateway IP, and DNS IP values.

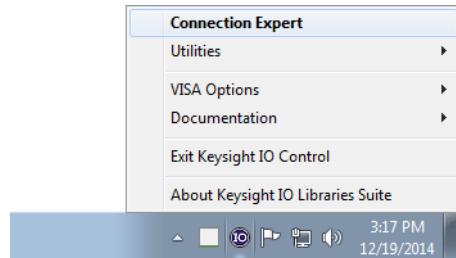

- When you are done, press the **[Back up]** key.
- e Press the **Host name** softkey. Use the softkeys and the Entry knob to enter the Host name.
- When you are done, press the **[Back up]** key.

Using the GPIB Interface

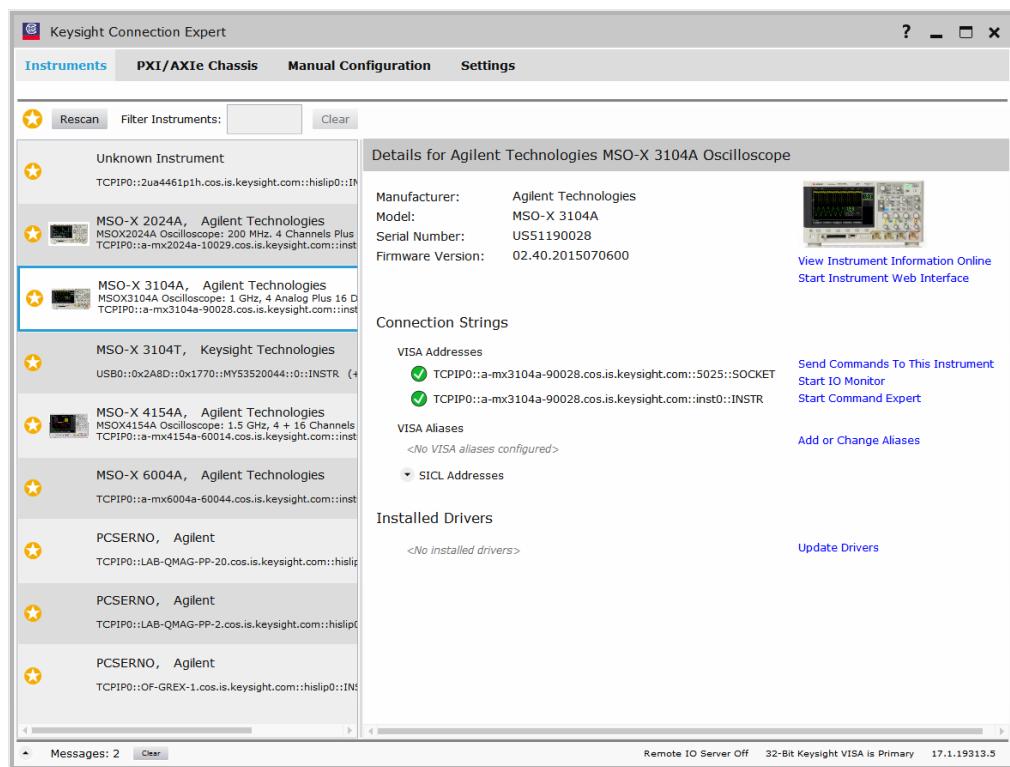

- 1 Connect a GPIB cable from the controller PC's GPIB interface to the "GPIB" port on the GPIB option module.
- 2 Configure the oscilloscope's GPIB interface:
 - a Press the **Configure** softkey until "GPIB" is selected.
 - b Use the Entry knob to select the **Address** value.

Step 3. Verify the oscilloscope connection

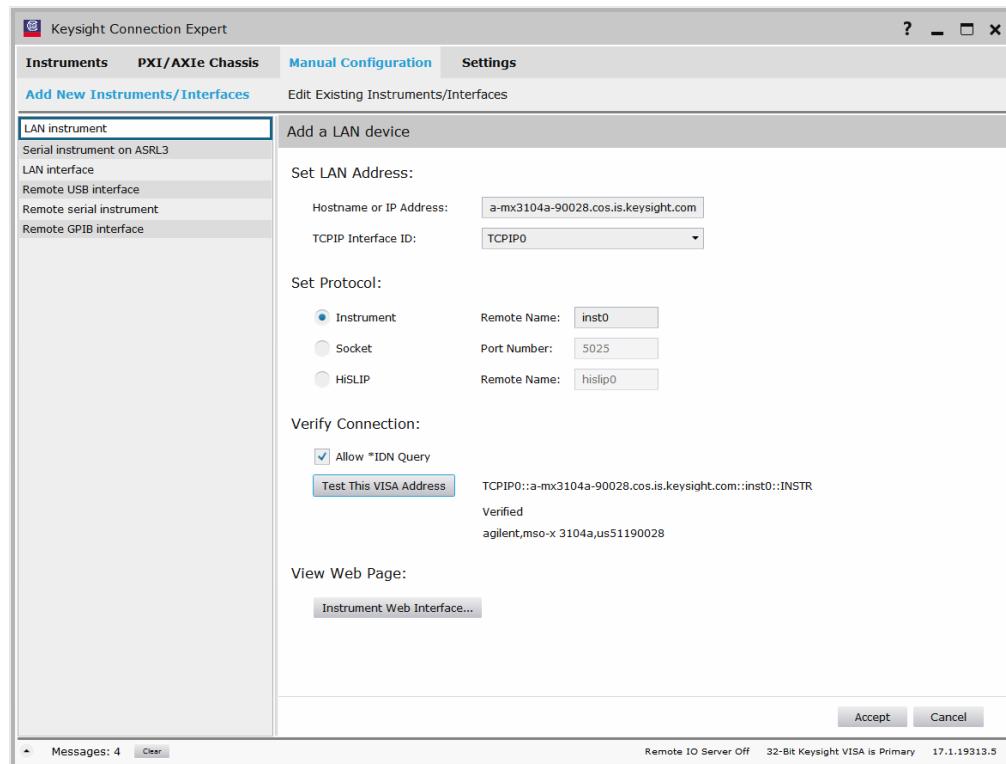

- 1 On the controller PC, click on the Keysight IO Control icon in the taskbar and choose **Connection Expert** from the popup menu.

- 2 In the Keysight Connection Expert application, instruments connected to the controller's USB and GPIB interfaces as well as instruments on the same LAN subnet should automatically appear in the Instruments tab.

- 3 If your instrument does not appear, you can add it using the Manual Configuration tab.

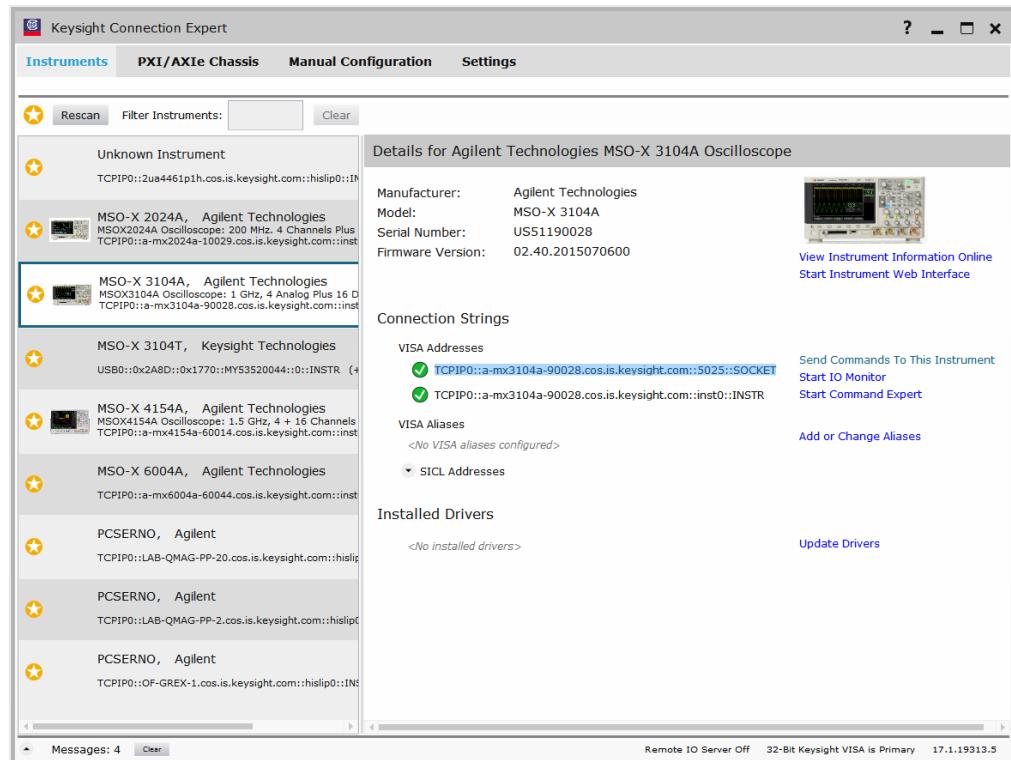

For example, to add a device:

- a Select **LAN instrument** in the list on the left.
- b Enter the oscilloscope's **Hostname or IP address**.
- c Select the protocol.
- d Select **Instrument** under Set Protocol.
- e Click **Test This VISA Address** to verify the connection.
- f If the connection test is successful, click **Accept** to add the instrument.

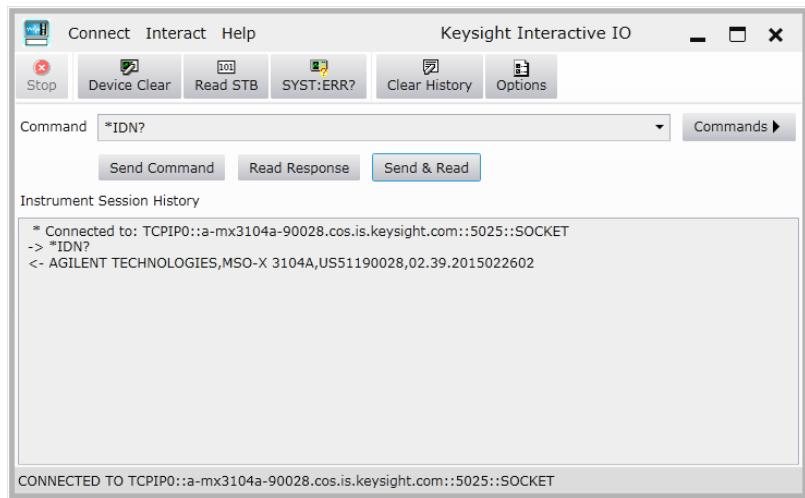

If the connection test is not successful, go back and verify the LAN connections and the oscilloscope setup.

4 Test some commands on the instrument:

- a** In the Details for the selected instrument, click **Send Commands To This Instrument**.

- b** In the Keysight Interactive IO application, enter commands in the **Command** field and press **Send Command**, **Read Response**, or **Send & Read**.

- c Choose **Connect > Exit** from the menu to exit the Keysight Interactive IO application.
- 5 In the Keysight Connection Expert application, choose **File > Exit** from the menu to exit the application.

3 Getting Started

Basic Oscilloscope Program Structure / 50

Programming the Oscilloscope / 52

Other Ways of Sending Commands / 61

This chapter gives you an overview of programming the 2000 X-Series oscilloscopes. It describes basic oscilloscope program structure and shows how to program the oscilloscope using a few simple examples.

The getting started examples show how to send oscilloscope setup, data capture, and query commands, and they show how to read query results.

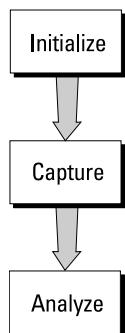

NOTE

Language for Program Examples

The programming examples in this guide are written in Visual Basic using the Keysight VISA COM library.

Basic Oscilloscope Program Structure

The following figure shows the basic structure of every program you will write for the oscilloscope.

Initializing

To ensure consistent, repeatable performance, you need to start the program, controller, and oscilloscope in a known state. Without correct initialization, your program may run correctly in one instance and not in another. This might be due to changes made in configuration by previous program runs or from the front panel of the oscilloscope.

- Program initialization defines and initializes variables, allocates memory, or tests system configuration.
- Controller initialization ensures that the interface to the oscilloscope is properly set up and ready for data transfer.
- Oscilloscope initialization sets the channel configuration, channel labels, threshold voltages, trigger specification, trigger mode, timebase, and acquisition type.

Capturing Data

Once you initialize the oscilloscope, you can begin capturing data for analysis. Remember that while the oscilloscope is responding to commands from the controller, it is not performing acquisitions. Also, when you change the oscilloscope configuration, any data already captured will most likely be rendered.

To collect data, you use the :DIGitize command. This command clears the waveform buffers and starts the acquisition process. Acquisition continues until acquisition memory is full, then stops. The acquired data is displayed by the oscilloscope, and the captured data can be measured, stored in acquisition memory in the oscilloscope, or transferred to the controller for further analysis. Any additional commands sent while :DIGITIZE is working are buffered until :DIGITIZE is complete.

You could also put the oscilloscope into run mode, then use a wait loop in your program to ensure that the oscilloscope has completed at least one acquisition before you make a measurement. Keysight does not recommend this because the needed length of the wait loop may vary, causing your program to fail. :DIGITIZE, on the other hand, ensures that data capture is complete. Also, :DIGITIZE, when complete, stops the acquisition process so that all measurements are on displayed data, not on a constantly changing data set.

Analyzing Captured Data

After the oscilloscope has completed an acquisition, you can find out more about the data, either by using the oscilloscope measurements or by transferring the data to the controller for manipulation by your program. Built-in measurements include: frequency, duty cycle, period, positive pulse width, and negative pulse width.

Using the :WAVEFORM commands, you can transfer the data to your controller. You may want to display the data, compare it to a known good measurement, or simply check logic patterns at various time intervals in the acquisition.

Referencing the IO Library

No matter which instrument programming library you use (SICL, VISA, or VISA COM), you must reference the library from your program.

In C/C++, you must tell the compiler where to find the include and library files (see the Keysight IO Libraries Suite documentation for more information).

To reference the Keysight VISA COM library in Visual Basic for Applications (VBA, which comes with Microsoft Office products like Excel):

- 1 Choose **Tools>References...** from the main menu.
- 2 In the References dialog, check the "VISA COM 3.0 Type Library".

3 Click **OK**.

To reference the Keysight VISA COM library in Microsoft Visual Basic 6.0:

- 1** Choose **Project>References...** from the main menu.
- 2** In the References dialog, check the "VISA COM 3.0 Type Library".
- 3** Click **OK**.

Opening the Oscilloscope Connection via the IO Library

PC controllers communicate with the oscilloscope by sending and receiving messages over a remote interface. Once you have opened a connection to the oscilloscope over the remote interface, programming instructions normally appear as ASCII character strings embedded inside write statements of the programming language. Read statements are used to read query responses from the oscilloscope.

For example, when using the Keysight VISA COM library in Visual Basic (after opening the connection to the instrument using the ResourceManager object's Open method), the FormattedIO488 object's WriteString, WriteNumber, WriteList, or WriteIEEEBlock methods are used for sending commands and queries. After a query is sent, the response is read using the ReadString, ReadNumber, ReadList, or ReadIEEEBlock methods.

The following Visual Basic statements open the connection and send a command that turns on the oscilloscope's label display.

```
Dim myMgr As VisaComLib.ResourceManager
Dim myScope As VisaComLib.FormattedIO488

Set myMgr = New VisaComLib.ResourceManager
Set myScope = New VisaComLib.FormattedIO488

' Open the connection to the oscilloscope. Get the VISA Address from the
' Keysight Connection Expert (installed with Keysight IO Libraries Suite
').
Set myScope.IO = myMgr.Open("<VISA Address>")

' Send a command.
myScope.WriteString ":DISPLAY:LABEL ON"
```

The ":DISPLAY:LABEL ON" in the above example is called a *program message*. Program messages are explained in more detail in "[Program Message Syntax](#)" on page 799.

Initializing the Interface and the Oscilloscope

To make sure the bus and all appropriate interfaces are in a known state, begin every program with an initialization statement. When using the Keysight VISA COM library, you can use the resource session object's Clear method to clear the interface buffer:

```

Dim myMgr As VisaComLib.ResourceManager
Dim myScope As VisaComLib.FormattedIO488

Set myMgr = New VisaComLib.ResourceManager
Set myScope = New VisaComLib.FormattedIO488

' Open the connection to the oscilloscope. Get the VISA Address from the
' Keysight Connection Expert (installed with Keysight IO Libraries Suite
').
Set myScope.IO = myMgr.Open("<VISA Address>")

' Clear the interface buffer and set the interface timeout to 10 seconds
.
myScope.IO.Clear
myScope.IO.Timeout = 10000

```

When you are using GPIB, CLEAR also resets the oscilloscope's parser. The parser is the program which reads in the instructions which you send it.

After clearing the interface, initialize the instrument to a preset state:

```
myScope.WriteString "*RST"
```

NOTE

Information for Initializing the Instrument

The actual commands and syntax for initializing the instrument are discussed in [Chapter 5](#), “Common (*) Commands,” starting on page 121.

Refer to the Keysight IO Libraries Suite documentation for information on initializing the interface.

Using :AUToscale to Automate Oscilloscope Setup

The :AUToscale command performs a very useful function for unknown waveforms by setting up the vertical channel, time base, and trigger level of the instrument.

The syntax for the autoscale command is:

```
myScope.WriteString ":AUToscale"
```

Using Other Oscilloscope Setup Commands

A typical oscilloscope setup would set the vertical range and offset voltage, the horizontal range, delay time, delay reference, trigger mode, trigger level, and slope. An example of the commands that might be sent to the oscilloscope are:

```

myScope.WriteString ":CHANnel1:PROBe 10"
myScope.WriteString ":CHANnel1:RANGE 16"
myScope.WriteString ":CHANnel1:OFFSet 1.00"
myScope.WriteString ":TIMEbase:MODE MAIN"
myScope.WriteString ":TIMEbase:RANGE 1E-3"
myScope.WriteString ":TIMEbase:DELay 100E-6"

```

Vertical is set to 16 V full-scale (2 V/div) with center of screen at 1 V and probe attenuation set to 10. This example sets the time base at 1 ms full-scale (100 ms/div) with a delay of 100 μ s.

Example Oscilloscope Setup Code

This program demonstrates the basic command structure used to program the oscilloscope.

```
' Initialize the instrument interface to a known state.
myScope.IO.Clear
myScope.IO.Timeout = 10000      ' Set interface timeout to 10 seconds.

' Initialize the instrument to a preset state.
myScope.WriteString "*RST"

' Set the time base mode to normal with the horizontal time at
' 50 ms/div with 0 s of delay referenced at the center of the
' graticule.
myScope.WriteString ":TIMEbase:RANGE 5E-4"      ' Time base to 50 us/div.
myScope.WriteString ":TIMEbase:DELay 0"           ' Delay to zero.
myScope.WriteString ":TIMEbase:REFerence CENTER"   ' Display ref. at
                                                ' center.

' Set the vertical range to 1.6 volts full scale with center screen
' at -0.4 volts with 10:1 probe attenuation and DC coupling.
myScope.WriteString ":CHANnel1:PROBe 10"          ' Probe attenuation
                                                ' to 10:1.
myScope.WriteString ":CHANnel1:RANGE 1.6"          ' Vertical range
                                                ' 1.6 V full scale.
myScope.WriteString ":CHANnel1:OFFSet -0.4"        ' Offset to -0.4.
myScope.WriteString ":CHANnel1:COUPLing DC"        ' Coupling to DC.

' Configure the instrument to trigger at -0.4 volts with normal
' triggering.
myScope.WriteString ":TRIGger:SWEep NORMAL"       ' Normal triggering.
myScope.WriteString ":TRIGger:LEVel -0.4"          ' Trigger level to -0.4.
myScope.WriteString ":TRIGger:SLOPe POSitive"     ' Trigger on pos. slope.

' Configure the instrument for normal acquisition.
myScope.WriteString ":ACQuire:TYPE NORMAL"        ' Normal acquisition.
```

Capturing Data with the :DIGITIZE Command

The :DIGITIZE command captures data that meets the specifications set up by the :ACQUIRE subsystem. When the digitize process is complete, the acquisition is stopped. The captured data can then be measured by the instrument or transferred to the controller for further analysis. The captured data consists of two parts: the waveform data record, and the preamble.

NOTE**Ensure New Data is Collected**

When you change the oscilloscope configuration, the waveform buffers are cleared. Before doing a measurement, send the :DIGitize command to the oscilloscope to ensure new data has been collected.

When you send the :DIGITIZE command to the oscilloscope, the specified channel signal is digitized with the current :ACQUIRE parameters. To obtain waveform data, you must specify the :WAVEFORM parameters for the SOURCE channel, the FORMAT type, and the number of POINTS prior to sending the :WAVEFORM:DATA? query.

NOTE**Set :TIMEbase:MODE to MAIN when using :DIGITIZE**

:TIMEbase:MODE must be set to MAIN to perform a :DIGITIZE command or to perform any :WAVEFORM subsystem query. A "Settings conflict" error message will be returned if these commands are executed when MODE is set to ROLL, XY, or WINDow (zoomed). Sending the *RST (reset) command will also set the time base mode to normal.

The number of data points comprising a waveform varies according to the number requested in the :ACQUIRE subsystem. The :ACQUIRE subsystem determines the number of data points, type of acquisition, and number of averages used by the :DIGITIZE command. This allows you to specify exactly what the digitized information contains.

The following program example shows a typical setup:

```
myScope.WriteString ":ACQUIRE:TYPE AVERAGE"
myScope.WriteString ":ACQUIRE:COMPLETE 100"
myScope.WriteString ":ACQUIRE:COUNT 8"
myScope.WriteString ":DIGITIZE CHANnel1"
myScope.WriteString ":WAVEFORM:SOURCE CHANnel1"
myScope.WriteString ":WAVEFORM:FORMAT BYTE"
myScope.WriteString ":WAVEFORM:POINTS 500"
myScope.WriteString ":WAVEFORM:DATA?"
```

This setup places the instrument into the averaged mode with eight averages. This means that when the :DIGITIZE command is received, the command will execute until the signal has been averaged at least eight times.

After receiving the :WAVEFORM:DATA? query, the instrument will start passing the waveform information.

Digitized waveforms are passed from the instrument to the controller by sending a numerical representation of each digitized point. The format of the numerical representation is controlled with the :WAVEFORM:FORMAT command and may be selected as BYTE, WORD, or ASCII.

The easiest method of transferring a digitized waveform depends on data structures, formatting available and I/O capabilities. You must scale the integers to determine the voltage value of each point. These integers are passed starting with the left most point on the instrument's display.

For more information, see the waveform subsystem commands and corresponding program code examples in [Chapter 30](#), “:WAVeform Commands,” starting on page 635.

NOTE

Aborting a Digitize Operation Over the Programming Interface

When using the programming interface, you can abort a digitize operation by sending a Device Clear over the bus (for example, `myScope.IO.Clear`).

Reading Query Responses from the Oscilloscope

After receiving a query (command header followed by a question mark), the instrument interrogates the requested function and places the answer in its output queue. The answer remains in the output queue until it is read or another command is issued. When read, the answer is transmitted across the interface to the designated listener (typically a controller).

The statement for reading a query response message from an instrument's output queue typically has a format specification for handling the response message.

When using the VISA COM library in Visual Basic, you use different read methods (`ReadString`, `ReadNumber`, `ReadList`, or `ReadIEEEBlock`) for the various query response formats. For example, to read the result of the query command `:CHANnel1:COUpling?` you would execute the statements:

```
myScope.WriteString ":CHANnel1:COUpling?"
Dim strQueryResult As String
strQueryResult = myScope.ReadString
```

This reads the current setting for the channel one coupling into the string variable `strQueryResult`.

All results for queries (sent in one program message) must be read before another program message is sent.

Sending another command before reading the result of the query clears the output buffer and the current response. This also causes an error to be placed in the error queue.

Executing a read statement before sending a query causes the controller to wait indefinitely.

The format specification for handling response messages depends on the programming language.

Reading Query Results into String Variables

The output of the instrument may be numeric or character data depending on what is queried. Refer to the specific command descriptions for the formats and types of data returned from queries.

NOTE

Express String Variables Using Exact Syntax

In Visual Basic, string variables are case sensitive and must be expressed exactly the same each time they are used.

The following example shows numeric data being returned to a string variable:

```
myScope.WriteString ":CHANnel1:RANGE?"
Dim strQueryResult As String
strQueryResult = myScope.ReadString
MsgBox "Range (string):" + strQueryResult
```

After running this program, the controller displays:

Range (string): +40.0E+00

Reading Query Results into Numeric Variables

The following example shows numeric data being returned to a numeric variable:

```
myScope.WriteString ":CHANnel1:RANGE?"
Dim varQueryResult As Variant
varQueryResult = myScope.ReadNumber
MsgBox "Range (variant):" + CStr(varQueryResult)
```

After running this program, the controller displays:

Range (variant): 40

Reading Definite-Length Block Query Response Data

Definite-length block query response data allows any type of device-dependent data to be transmitted over the system interface as a series of 8-bit binary data bytes. This is particularly useful for sending large quantities of data or 8-bit extended ASCII codes. The syntax is a pound sign (#) followed by a non-zero digit representing the number of digits in the decimal integer. After the non-zero digit is the decimal integer that states the number of 8-bit data bytes being sent. This is followed by the actual data.

For example, for transmitting 1000 bytes of data, the syntax would be:

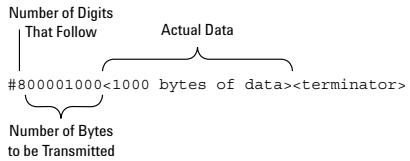

Figure 2 Definite-length block response data

The "8" states the number of digits that follow, and "00001000" states the number of bytes to be transmitted.

The VISA COM library's ReadIEEEBlock and WriteIEEEBlock methods understand the definite-length block syntax, so you can simply use variables that contain the data:

```
' Read oscilloscope setup using ":SYSTem:SETup?" query.
myScope.WriteString ":SYSTem:SETup?"
Dim varQueryResult As Variant
varQueryResult = myScope.ReadIEEEBlock(BinaryType_UI1)

' Write learn string back to oscilloscope using ":SYSTem:SETup" command:
myScope.WriteIEEEBlock ":SYSTem:SETup ", varQueryResult
```

Sending Multiple Queries and Reading Results

You can send multiple queries to the instrument within a single command string, but you must also read them back as a single query result. This can be accomplished by reading them back into a single string variable, multiple string variables, or multiple numeric variables.

For example, to read the :TIMEbase:RANGE?;DElay? query result into a single string variable, you could use the commands:

```
myScope.WriteString ":TIMEbase:RANGE?;DElay?"
Dim strQueryResult As String
strQueryResult = myScope.ReadString
MsgBox "Timebase range; delay:" + strQueryResult
```

When you read the result of multiple queries into a single string variable, each response is separated by a semicolon. For example, the output of the previous example would be:

```
Timebase range; delay: <range_value>;<delay_value>
```

To read the :TIMEbase:RANGE?;DElay? query result into multiple string variables, you could use the ReadList method to read the query results into a string array variable using the commands:

```
myScope.WriteString ":TIMEbase:RANGE?;DElay?"
Dim strResults() As String
strResults() = myScope.ReadList(ASCIIIType_BSTR)
MsgBox "Timebase range: " + strResults(0) + ", delay: " + strResults(1)
```

To read the :TIMEbase:RANGE?;DElay? query result into multiple numeric variables, you could use the ReadList method to read the query results into a variant array variable using the commands:

```
myScope.WriteString ":TIMEbase:RANGE?;DElay?"
Dim varResults() As Variant
varResults() = myScope.ReadList
MsgBox "Timebase range: " + FormatNumber(varResults(0) * 1000, 4) + _
       " ms, delay: " + FormatNumber(varResults(1) * 1000000, 4) + " us"
```

Checking Instrument Status

Status registers track the current status of the instrument. By checking the instrument status, you can find out whether an operation has been completed, whether the instrument is receiving triggers, and more.

For more information, see [Chapter 35, “Status Reporting,”](#) starting on page 767 which explains how to check the status of the instrument.

Other Ways of Sending Commands

Standard Commands for Programmable Instrumentation (SCPI) can also be sent via a Telnet socket or through the Browser Web Control:

- "[Telnet Sockets](#)" on page 61
- "[Sending SCPI Commands Using Browser Web Control](#)" on page 61

Telnet Sockets

The following information is provided for programmers who wish to control the oscilloscope with SCPI commands in a Telnet session.

To connect to the oscilloscope via a telnet socket, issue the following command:

```
telnet <hostname> 5024
```

where <hostname> is the hostname of the oscilloscope. This will give you a command line with prompt.

For a command line without a prompt, use port 5025. For example:

```
telnet <hostname> 5025
```

Sending SCPI Commands Using Browser Web Control

To send SCPI commands using the Browser Web Control feature, establish a connection to the oscilloscope via LAN as described in the *InfiniiVision 2000 X-Series Oscilloscopes User's Guide*. When you make the connection to the oscilloscope via LAN and the instrument's welcome page is displayed, select the **Browser Web Control** tab, then select the **Remote Programming** link.

Number Format

NR1 specifies integer data.

NR3 specifies exponential data in floating point format (for example, -1.0E-3).

<NL> (Line Terminator)

<NL> = new line or linefeed (ASCII decimal 10).

The line terminator, or a leading colon, will send the parser to the "root" of the command tree.

[] (Optional Syntax Terms)

Items enclosed in square brackets, [], are optional.

{ } (Braces)

When several items are enclosed by braces, { }, only one of these elements may be selected. Vertical line (|) indicates "or". For example, {ON | OFF} indicates that only ON or OFF may be selected, not both.

::= (Defined As)

::= means "defined as".

For example, <A> ::= indicates that <A> can be replaced by in any statement containing <A>.

< > (Angle Brackets)

< > Angle brackets enclose words or characters that symbolize a program code parameter or an interface command.

... (Ellipsis)

... An ellipsis (trailing dots) indicates that the preceding element may be repeated one or more times.

n,...,p (Value Ranges)

n,...,p ::= all integers between n and p inclusive.

d (Digits)

d ::= A single ASCII numeric character 0 - 9.

Quoted ASCII String

A quoted ASCII string is a string delimited by either double quotes ("") or single quotes (''). Some command parameters require a quoted ASCII string. For example, when using the Keysight VISA COM library in Visual Basic, the command:

```
myScope.WriteString " :CHANNEL1:LABEL 'One'"
```

has a quoted ASCII string of:

```
'one'
```

In order to read quoted ASCII strings from query return values, some programming languages require special handling or syntax.

Definite-Length Block Response Data

Definite-length block response data allows any type of device-dependent data to be transmitted over the system interface as a series of 8-bit binary data bytes. This is particularly useful for sending large quantities of data or 8-bit extended ASCII codes. This syntax is a pound sign (#) followed by a non-zero digit representing the number of digits in the decimal integer. After the non-zero digit is the decimal integer that states the number of 8-bit data bytes being sent. This is followed by the actual data.

For example, for transmitting 1000 bytes of data, the syntax would be

```
#800001000<1000 bytes of data> <NL>
```

8 is the number of digits that follow

00001000 is the number of bytes to be transmitted

<1000 bytes of data> is the actual data

Introduction to Common (*) Commands The common commands are defined by the IEEE 488.2 standard. They are implemented by all instruments that comply with the IEEE 488.2 standard. They provide some of the basic instrument functions, such as instrument identification and reset, reading the instrument setup, and determining how status is read and cleared.

Common commands can be received and processed by the instrument whether they are sent over the interface as separate program messages or within other program messages. If an instrument subsystem has been selected and a common

command is received by the instrument, the instrument remains in the selected subsystem. For example, if the program message ":ACQuire:TYPE AVERage; *CLS; COUNT 256" is received by the instrument, the instrument sets the acquire type, then clears the status information and sets the average count.

In contrast, if a root level command or some other subsystem command is within the program message, you must re-enter the original subsystem after the command. For example, the program message ":ACQuire:TYPE AVERage; :AUToscale; :ACQuire:COUNt 256" sets the acquire type, completes the autoscale, then sets the acquire count. In this example, :ACQuire must be sent again after the :AUToscale command in order to re-enter the ACQuire subsystem and set the count.

NOTE

Each of the status registers has an enable (mask) register. By setting the bits in the enable register, you can select the status information you want to use.

*CLS (Clear Status)

 (see [page 798](#))

Command Syntax *CLS

The *CLS common command clears the status data structures, the device-defined error queue, and the Request-for-OPC flag.

NOTE If the *CLS command immediately follows a program message terminator, the output queue and the MAV (message available) bit are cleared.

*ESE (Standard Event Status Enable)

C (see [page 798](#))

Command Syntax *ESE <mask_argument>

<mask_argument> ::= integer from 0 to 255

The *ESE common command sets the bits in the Standard Event Status Enable Register. The Standard Event Status Enable Register contains a mask value for the bits to be enabled in the Standard Event Status Register. A "1" in the Standard Event Status Enable Register enables the corresponding bit in the Standard Event Status Register. A zero disables the bit.

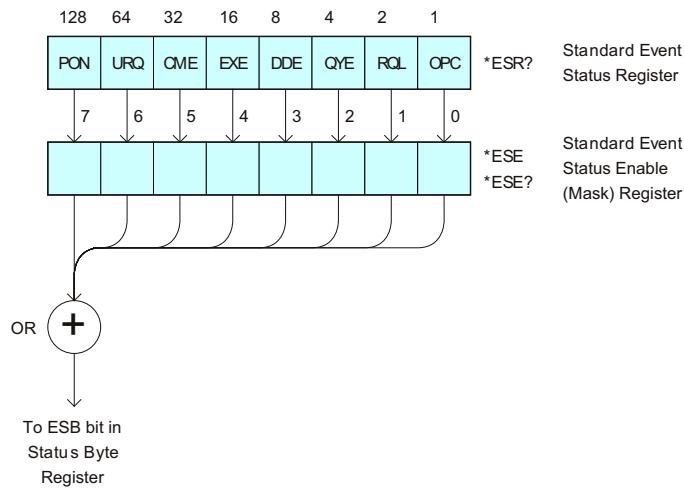

Table 45 Standard Event Status Enable (ESE)

Bit	Name	Description	When Set (1 = High = True), Enables:
7	PON	Power On	Event when an OFF to ON transition occurs.
6	URQ	User Request	Event when a front-panel key is pressed.
5	CME	Command Error	Event when a command error is detected.
4	EXE	Execution Error	Event when an execution error is detected.
3	DDE	Device Dependent Error	Event when a device-dependent error is detected.
2	QYE	Query Error	Event when a query error is detected.
1	RQL	Request Control	Event when the device is requesting control. (Not used.)
0	OPC	Operation Complete	Event when an operation is complete.

Query Syntax *ESE?

The *ESE? query returns the current contents of the Standard Event Status Enable Register.

Return Format <mask_argument><NL>
<mask_argument> ::= 0, . . . , 255; an integer in NR1 format.

*ESR (Standard Event Status Register)

C (see [page 798](#))

Query Syntax *ESR?

The *ESR? query returns the contents of the Standard Event Status Register. When you read the Event Status Register, the value returned is the total bit weights of all of the bits that are high at the time you read the byte. Reading the register clears the Event Status Register.

The following table shows bit weight, name, and condition for each bit.

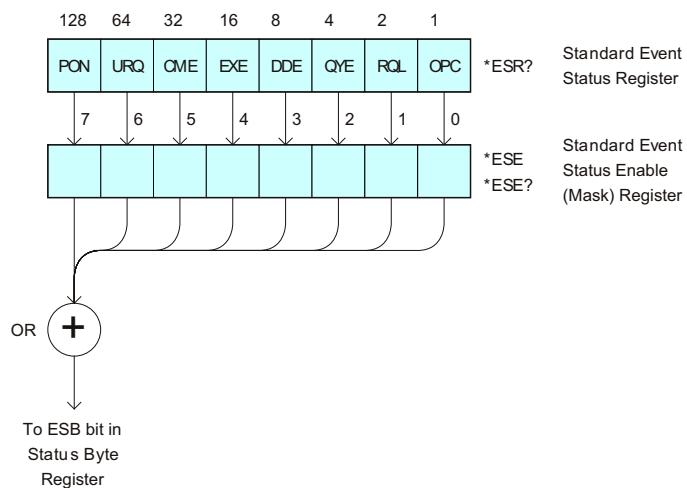

Table 46 Standard Event Status Register (ESR)

Bit	Name	Description	When Set (1 = High = True), Indicates:
7	PON	Power On	An OFF to ON transition has occurred.
6	URQ	User Request	A front-panel key has been pressed.
5	CME	Command Error	A command error has been detected.
4	EXE	Execution Error	An execution error has been detected.
3	DDE	Device Dependent Error	A device-dependent error has been detected.
2	QYE	Query Error	A query error has been detected.
1	RQL	Request Control	The device is requesting control. (Not used.)
0	OPC	Operation Complete	Operation is complete.

Return Format <status><NL>

<status> ::= 0, . . . , 255; an integer in NR1 format.

NOTE

Reading the Standard Event Status Register clears it. High or 1 indicates the bit is true.

*IDN (Identification Number)

 (see [page 798](#))

Query Syntax *IDN?

The *IDN? query identifies the instrument type and software version.

Return Format AGILENT TECHNOLOGIES,<model>,<serial number>,X.XX.XX <NL>

<model> ::= the model number of the instrument

<serial number> ::= the serial number of the instrument

X.XX.XX ::= the software revision of the instrument

See Also • ["Introduction to Common \(*\) Commands"](#) on page 123
• ["*OPT \(Option Identification\)"](#) on page 133

*LRN (Learn Device Setup)

 (see [page 798](#))

Query Syntax

`*LRN?`

The `*LRN?` query result contains the current state of the instrument. This query is similar to the `:SYST:SETR?` (see [page 582](#)) query, except that it contains `".SYST:SET "` before the binary block data. The query result is a valid command that can be used to restore instrument settings at a later time.

Return Format

```
<learn_string><NL>
<learn_string> ::= :SYST:SET <setup_data>
<setup_data> ::= binary block data in IEEE 488.2 # format
```

`<learn_string>` specifies the current instrument setup. The block size is subject to change with different firmware revisions.

NOTE

The `*LRN?` query return format has changed from previous Keysight oscilloscopes to match the IEEE 488.2 specification which says that the query result must contain `".SYST:SET "` before the binary block data.

*OPC (Operation Complete)

 (see [page 798](#))

Command Syntax *OPC

The *OPC command sets the operation complete bit in the Standard Event Status Register when all pending device operations have finished.

Query Syntax *OPC?

The *OPC? query places an ASCII "1" in the output queue when all pending device operations have completed. The interface hangs until this query returns.

Example Code

```

' RESET - This command puts the oscilloscope into a known state.
' This statement is very important for programs to work as expected.
' Most of the following initialization commands are initialized by
' *RST. It is not necessary to reinitialize them unless the default
' setting is not suitable for your application.
myScope.WriteString "*RST"  ' Reset the oscilloscope to the defaults.

```

See complete example programs at: [Chapter 38, “Programming Examples,”](#) starting on page 807

*SAV (Save)

 (see [page 798](#))

Command Syntax *SAV <value>

```
<value> ::= {0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9}
```

The *SAV command stores the current state of the instrument in a save register. The data parameter specifies the register where the data will be saved.

• ["*RCL \(Recall\)"](#) on page 135

*SRE (Service Request Enable)

C (see [page 798](#))

Command Syntax *SRE <mask>

<mask> ::= integer with values defined in the following table.

The *SRE command sets the bits in the Service Request Enable Register. The Service Request Enable Register contains a mask value for the bits to be enabled in the Status Byte Register. A one in the Service Request Enable Register enables the corresponding bit in the Status Byte Register. A zero disables the bit.

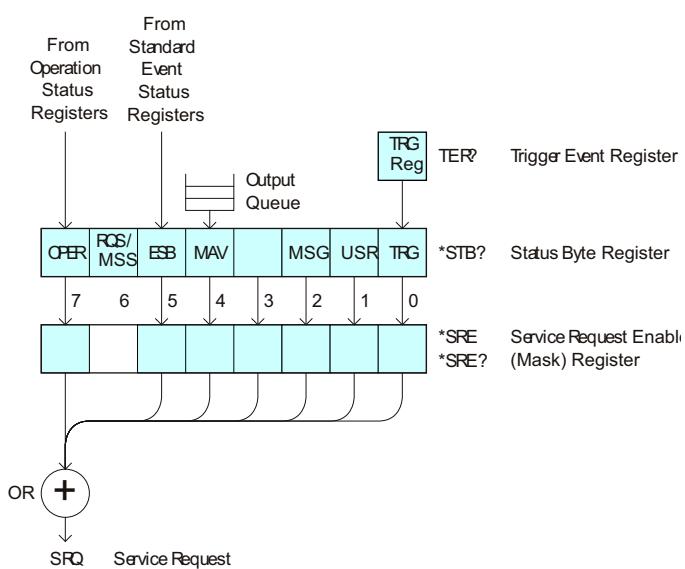

Table 47 Service Request Enable Register (SRE)

Bit	Name	Description	When Set (1 = High = True), Enables:
7	OPER	Operation Status Register	Interrupts when enabled conditions in the Operation Status Register (OPER) occur.
6	---	---	(Not used.)
5	ESB	Event Status Bit	Interrupts when enabled conditions in the Standard Event Status Register (ESR) occur.
4	MAV	Message Available	Interrupts when messages are in the Output Queue.
3	---	---	(Not used.)
2	MSG	Message	Interrupts when an advisory has been displayed on the oscilloscope.
1	USR	User Event	Interrupts when enabled user event conditions occur.
0	TRG	Trigger	Interrupts when a trigger occurs.

Query Syntax *SRE?

The *SRE? query returns the current value of the Service Request Enable Register.

Return Format <mask><NL>

<mask> ::= sum of all bits that are set, 0,...,255;
an integer in NR1 format

***STB (Read Status Byte)**

C (see [page 798](#))

Query Syntax *STB?

The *STB? query returns the current value of the instrument's status byte. The MSS (Master Summary Status) bit is reported on bit 6 instead of the RQS (request service) bit. The MSS indicates whether or not the device has at least one reason for requesting service.

Return Format <value><NL>

<value> ::= 0, ..., 255; an integer in NR1 format

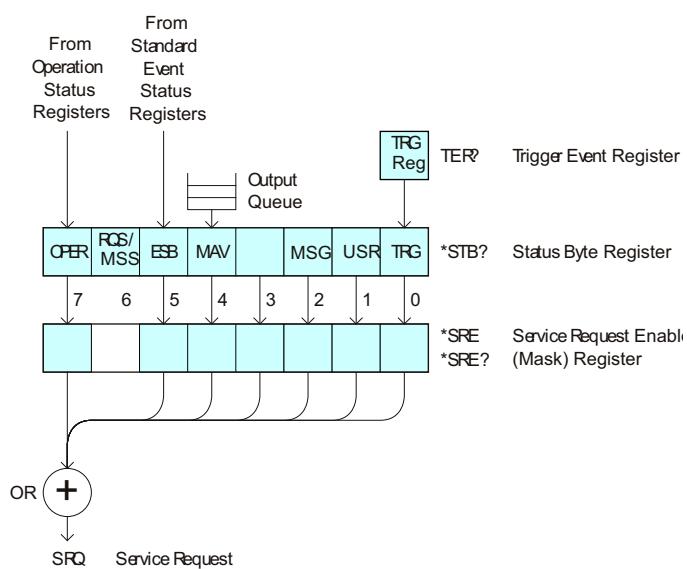

Table 48 Status Byte Register (STB)

Bit	Name	Description	When Set (1 = High = True), Indicates:
7	OPER	Operation Status Register	An enabled condition in the Operation Status Register (OPER) has occurred.
6	RQS	Request Service	When polled, that the device is requesting service.
	MSS	Master Summary Status	When read (by *STB?), whether the device has a reason for requesting service.
5	ESB	Event Status Bit	An enabled condition in the Standard Event Status Register (ESR) has occurred.
4	MAV	Message Available	There are messages in the Output Queue.
3	---	---	(Not used, always 0.)
2	MSG	Message	An advisory has been displayed on the oscilloscope.
1	USR	User Event	An enabled user event condition has occurred.
0	TRG	Trigger	A trigger has occurred.

NOTE

To read the instrument's status byte with RQS reported on bit 6, use the interface Serial Poll.

*TST (Self Test)

 (see [page 798](#))

Query Syntax *TST?

The *TST? query performs a self-test on the instrument. The result of the test is placed in the output queue. A zero indicates the test passed and a non-zero indicates the test failed. If the test fails, refer to the troubleshooting section of the *Service Guide*.

Return Format <result><NL>

<result> ::= 0 or non-zero value; an integer in NR1 format

See Also • ["Introduction to Common \(*\) Commands"](#) on page 123

*WAI (Wait To Continue)

 (see [page 798](#))

Introduction to Root (:) Commands Root level commands control many of the basic operations of the instrument. These commands are always recognized by the parser if they are prefixed with a colon, regardless of current command tree position. After executing a root-level command, the parser is positioned at the root of the command tree.

:ACTivity

N (see [page 798](#))

Command Syntax :ACTivity

The :ACTivity command clears the cumulative edge variables for the next activity query.

Query Syntax :ACTivity?

The :ACTivity? query returns whether there has been activity (edges) on the digital channels since the last query, and returns the current logic levels.

NOTE

Because the :ACTivity? query returns edge activity since the last :ACTivity? query, you must send this query twice before the edge activity result is valid.

Return Format

```
<edges>,<levels><NL>
<edges> ::= presence of edges (16-bit integer in NR1 format).
<levels> ::= logical highs or lows (16-bit integer in NR1 format).
bit 0 ::= DIGital 0
bit 15 ::= DIGital 15
```

NOTE

A bit = 0 (zero) in the <edges> result indicates that no edges were detected on that channel (across the specified threshold voltage) since the last query.

A bit = 1 (one) in the <edges> result indicates that edges have been detected on that channel (across the specified threshold voltage) since the last query.

(The threshold voltage must be set appropriately for the logic levels of the signals being probed.)

:AER (Arm Event Register)

 (see [page 798](#))

Query Syntax :AER?

The AER query reads the Arm Event Register. After the Arm Event Register is read, it is cleared. A "1" indicates the trigger system is in the armed state, ready to accept a trigger.

The Armed Event Register is summarized in the Wait Trig bit of the Operation Status Event Register. A Service Request can be generated when the Wait Trig bit transitions and the appropriate enable bits have been set in the Operation Status Enable Register (OPEE) and the Service Request Enable Register (SRE).

Return Format <value><NL>

<value> ::= {0 | 1}; an integer in NR1 format.

:AUToscale

C (see [page 798](#))

Command Syntax

```
:AUToscale
:AUToscale [<source>[,...<source>]]
<source> ::= CHANnel<n> for the DSO models
<source> ::= {DIGItal<d> | POD1 | POD2 | CHANnel<n>} for the
MSO models
<n> ::= 1 to (# analog channels) in NR1 format
<d> ::= 0 to (# digital channels - 1) in NR1 format
The <source> parameter may be repeated up to 5 times.
```

The :AUToscale command evaluates all input signals and sets the correct conditions to display the signals. This is the same as pressing the **[Auto Scale]** key on the front panel.

If one or more sources are specified, those specified sources will be enabled and all others blanked. The autoscale channels mode (see "[:AUToscale:CHANNels](#)" on page 156) is set to DISPlayed channels. Then, the autoscale is performed.

When the :AUToscale command is sent, the following conditions are affected and actions are taken:

- Thresholds.
- Channels with activity around the trigger point are turned on, others are turned off.
- Channels are reordered on screen; analog channel 1 first, followed by the remaining analog channels, then the digital channels 0-15.
- Delay is set to 0 seconds.
- Time/Div.

The :AUToscale command does not affect the following conditions:

- Label names.
- Trigger conditioning.

The :AUToscale command turns off the following items:

- Cursors.
- Measurements.
- Math waveforms.
- Reference waveforms.
- Zoomed (delayed) time base mode.

For further information on :AUToscale, see the *User's Guide*.

:AUToscale:AMODE

N (see [page 798](#))

Command Syntax :AUToscale:AMODE <value>

<value> ::= {NORMal | CURRent}

The :AUToscale:AMODE command specifies the acquisition mode that is set by subsequent :AUToscales.

- When NORMal is selected, an :AUToscale command sets the NORMal acquisition type and the RTIMe (real-time) acquisition mode.
- When CURRent is selected, the current acquisition type and mode are kept on subsequent :AUToscales.

Use the :ACQuire:TYPE and :ACQuire:MODE commands to set the acquisition type and mode.

Query Syntax :AUToscale:AMODE?

The :AUToscale:AMODE? query returns the autoscale acquire mode setting.

Return Format <value><NL>

<value> ::= {NORM | CURR}

:AUToscale:CHANnels

N (see [page 798](#))

Command Syntax `:AUToscale:CHANnels <value>`
 `<value> ::= {ALL | DISPlayed}`

The :AUToscale:CHANnels command specifies which channels will be displayed on subsequent :AUToscales.

- When ALL is selected, all channels that meet the requirements of :AUToscale will be displayed.
- When DISPlayed is selected, only the channels that are turned on are autoscaled.

Use the :VIEW or :BLANK root commands to turn channels on or off.

Query Syntax `:AUToscale:CHANnels?`

The :AUToscale:CHANnels? query returns the autoscale channels setting.

Return Format `<value><NL>`
 `<value> ::= {ALL | DISP}`

:AUToscale:FDEBug

N (see [page 798](#))

Command Syntax :AUToscale:FDEBug <on_off>

<on_off> ::= {{1 | ON} | {0 | OFF}}

The :AUToscale:FDEBug command turns fast debug auto scaling on or off.

The Fast Debug option changes the behavior of :AUToscale to let you make quick visual comparisons to determine whether the signal being probed is a DC voltage, ground, or an active AC signal.

Channel coupling is maintained for easy viewing of oscillating signals.

Query Syntax :AUToscale:FDEBug?

The :AUToscale:FDEBug? query returns the current autoscale fast debug setting.

Return Format <on_off><NL>

<on_off> ::= {1 | 0}

:BLANK

N (see [page 798](#))

Command Syntax

```
:BLANK [<source>]

<source> ::= {CHANnel<n> | FUNCtion | MATH | SBUS1 | WMEMory<r>}
           for the DSO models

<source> ::= {CHANnel<n> | DIGItal<d> | POD{1 | 2}
           | BUS{1 | 2} | FUNCtion | MATH | SBUS1 | WMEMory<r>}
           for the MSO models

<n> ::= 1 to (# analog channels) in NR1 format

<d> ::= 0 to (# digital channels - 1) in NR1 format

<r> ::= 1 to (# ref waveforms) in NR1 format
```

The :BLANK command turns off (stops displaying) the specified channel, digital pod, math function, or serial decode bus. The :BLANK command with no parameter turns off all sources.

NOTE

To turn on (start displaying) a channel, etc., use the :VIEW command. The DISPLAY commands, :CHANnel<n>:DISPLAY, :FUNCtion:DISPLAY, :POD<n>:DISPLAY, :DIGItal<n>:DISPLAY, :SBUS<n>:DISPLAY, or :WMEMory<r>:DISPLAY, are the preferred method to turn on/off a channel, etc.

MATH is an alias for FUNCtion.

:DIGItize [<source>[, . . . ,<source>]]  
<source> ::= {CHANnel<n> | FUNCtion | MATH | SBUS1}  
          for the DSO models  
  
<source> ::= {CHANnel<n> | DIGItal<d> | POD{1 | 2}

<n> ::= 1 to (# analog channels) in NR1 format  
  
<d> ::= 0 to (# digital channels - 1) in NR1 format  
  
The <source> parameter may be repeated up to 5 times.
```

The :DIGItize command is a specialized RUN command. It causes the instrument to acquire waveforms according to the settings of the :ACQuire commands subsystem. When the acquisition is complete, the instrument is stopped.

If no argument is given, :DIGItize acquires the channels currently displayed. If no channels are displayed, all channels are acquired.

NOTE

The :DIGItize command is only executed when the :TIMEbase:MODE is MAIN or WINDOW.

NOTE

To halt a :DIGItize in progress, use the device clear command.

NOTE

MATH is an alias for FUNCtion.

:OVLenable (Overload Event Enable Register)

C (see [page 798](#))

Command Syntax :OVLenable <enable_mask>

<enable_mask> ::= 16-bit integer

The overload enable mask is an integer representing an input as described in the following table.

The :OVLenable command sets the mask in the Overload Event Enable Register and enables the reporting of the Overload Event Register. If an overvoltage is sensed on a 50Ω input, the input will automatically switch to $1 M\Omega$ input impedance. If enabled, such an event will set bit 11 in the Operation Status Register.

NOTE

You can set analog channel input impedance to 50Ω on the 300 MHz, 500 MHz, and 1 GHz bandwidth oscilloscope models. On these same bandwidth models, if there are only two analog channels, you can also set external trigger input impedance to 50Ω .

Query Syntax :OVLenable?

The :OVLenable query returns the current enable mask value contained in the Overload Event Enable Register.

Return Format <enable_mask><NL>

<enable_mask> ::= integer in NR1 format.

:OVLRegister (Overload Event Register)

C (see [page 798](#))

Query Syntax :OVLRegister?

The :OVLRegister query returns the overload protection value stored in the Overload Event Register (OCLR). If an overvoltage is sensed on a 50Ω input, the input will automatically switch to $1 M\Omega$ input impedance. A "1" indicates an overload has occurred.

NOTE

You can set analog channel input impedance to 50Ω on the 300 MHz, 500 MHz, and 1 GHz band width oscilloscope models. On these same band width models, if there are only two analog channels, you can also set external trigger input impedance to 50Ω .

:ACQuire:TYPE <type> (see page 195)	:ACQuire:TYPE? (see page 195)	<type> ::= {NORMAL AVERage HRESolution PEAK}

Introduction to :ACQuire Commands The ACQuire subsystem controls the way in which waveforms are acquired. These acquisition types are available: normal, averaging, peak detect, and high resolution.

Normal

The :ACQuire:TYPE NORMal command sets the oscilloscope in the normal acquisition mode. For the majority of user models and signals, NORMal mode yields the best oscilloscope picture of the waveform.

Averaging

The :ACQuire:TYPE AVERage command sets the oscilloscope in the averaging mode. You can set the count by sending the :ACQuire:COUNt command followed by the number of averages. In this mode, the value for averages is an integer from 2 to 65536. The COUNt value determines the number of averages that must be acquired.

High-Resolution

The :ACQuire:TYPE HRESolution command sets the oscilloscope in the high-resolution mode (also known as *smoothing*). This mode is used to reduce noise at slower sweep speeds where the digitizer samples faster than needed to fill memory for the displayed time range. Instead of decimating samples, they are averaged together to provide the value for one display point. The slower the sweep speed, the greater the number of samples that are averaged together for each display point.

Peak Detect

The :ACQuire:TYPE PEAK command sets the oscilloscope in the peak detect mode. In this mode, :ACQuire:COUNt has no meaning.

Reporting the Setup

Use :ACQuire? to query setup information for the ACQuire subsystem.

Return Format

The following is a sample response from the :ACQuire? query. In this case, the query was issued following a *RST command.

```
:ACQ:MODE RTIM;TYPE NORM;COMP 100;COUNT 8;SEGM:COUN 2
```

:ACQuire:COMplete

C (see [page 798](#))

Command Syntax	<code>:ACQuire:COMplete <complete></code> <code><complete> ::= 100; an integer in NR1 format</code>
	The :ACQuire:COMplete command affects the operation of the :DIGitize command. It specifies the minimum completion criteria for an acquisition. The parameter determines the percentage of the time buckets that must be "full" before an acquisition is considered complete. If :ACQuire:TYPE is NORMAl, it needs only one sample per time bucket for that time bucket to be considered full.
	The only legal value for the :COMplete command is 100. All time buckets must contain data for the acquisition to be considered complete.
Query Syntax	<code>:ACQuire:COMplete?</code>
	The :ACQuire:COMplete? query returns the completion criteria (100) for the currently selected mode.
Return Format	<code><completion_criteria><NL></code> <code><completion_criteria> ::= 100; an integer in NR1 format</code>
See Also	<ul style="list-style-type: none"> · "Introduction to :ACQuire Commands" on page 183 · ":ACQuire:TYPE" on page 195 · ":DIGITIZE" on page 159 · ":WAVEFORM:POINTs" on page 648
Example Code	<pre>' AQUIRE_COMPLETE - Specifies the minimum completion criteria for ' an acquisition. The parameter determines the percentage of time ' buckets needed to be "full" before an acquisition is considered ' to be complete. myScope.WriteString ":ACQuire:COMplete 100"</pre>
	See complete example programs at: Chapter 38 , "Programming Examples," starting on page 807

:ACQuire:COUNt

C (see [page 798](#))

Command Syntax `:ACQuire:COUNt <count>`

`<count>` ::= integer in NR1 format

In averaging mode, the :ACQuire:COUNt command specifies the number of values to be averaged for each time bucket before the acquisition is considered to be complete for that time bucket. When :ACQuire:TYPE is set to AVERage, the count can be set to any value from 2 to 65536.

NOTE

The :ACQuire:COUNt 1 command has been deprecated. The AVERage acquisition type with a count of 1 is functionally equivalent to the HRESolution acquisition type; however, you should select the high-resolution acquisition mode with the :ACQuire:TYPE HRESolution command instead.

Query Syntax `:ACQuire:COUNT?`

The :ACQuire:COUNT? query returns the currently selected count value for averaging mode.

Return Format `<count_argument><NL>`

`<count_argument>` ::= an integer from 2 to 65536 in NR1 format

<mode> ::= {RTIMe | SEGmented}

The :ACQuire:MODE command sets the acquisition mode of the oscilloscope.

- The :ACQuire:MODE RTIMe command sets the oscilloscope in real time mode.

NOTE

The obsolete command ACQuire:TYPE:REALtime is functionally equivalent to sending ACQuire:MODE RTIMe; TYPE NORMAl.

- The :ACQuire:MODE SEGmented command sets the oscilloscope in segmented memory mode.

Query Syntax :ACQuire:MODE?

The :ACQuire:MODE? query returns the acquisition mode of the oscilloscope.

Return Format <mode_argument><NL>

<mode_argument> ::= {RTIM | SEGM}

- See Also**
- "[Introduction to :ACQuire Commands](#)" on page 183
 - "[":ACQuire:TYPE"](#) on page 195

:ACQuire:POINts

 (see [page 798](#))

Query Syntax `:ACQuire:POINts?`

The `:ACQuire:POINts?` query returns the number of data points that the hardware will acquire from the input signal. The number of points acquired is not directly controllable. To set the number of points to be transferred from the oscilloscope, use the command `:WAVeform:POINts`. The `:WAVeform:POINts?` query will return the number of points available to be transferred from the oscilloscope.

Return Format `<points_argument><NL>`

`<points_argument>` ::= an integer in NR1 format

:ACQuire:SEGMENTed:ANALyze

N (see [page 798](#))

Command Syntax :ACQuire:SEGMENTed:ANALyze

NOTE This command is available when the segmented memory option (Option SGM) is enabled.

This command calculates measurement statistics and/or infinite persistence over all segments that have been acquired. It corresponds to the front panel **Analyze Segments** softkey which appears in both the Measurement Statistics and Segmented Memory Menus.

In order to use this command, the oscilloscope must be stopped and in segmented acquisition mode, with either quick measurements or infinite persistence on.

:ACQuire:SEGmented:COUNt

N (see [page 798](#))

Command Syntax `:ACQuire:SEGmented:COUNt <count>`
`<count> ::= an integer from 2 to 25 (w/100K memory) in NR1 format`

NOTE This command is available when the segmented memory option (Option SGM) is enabled.

The :ACQuire:SEGmented:COUNt command sets the number of memory segments to acquire.

The segmented memory acquisition mode is enabled with the :ACQuire:MODE command, and data is acquired using the :DIGitize, :SINGle, or :RUN commands. The number of memory segments in the current acquisition is returned by the :WAVeform:SEGmented:COUNt? query.

The maximum number of segments may be limited by the memory depth of your oscilloscope. For example, an oscilloscope with 100K memory allows a maximum of 25 segments.

Query Syntax `:ACQuire:SEGmented:COUNt?`

The :ACQuire:SEGmented:COUNt? query returns the current count setting.

Return Format `<count><NL>`
`<count> ::= an integer from 2 to 25 (w/100K memory) in NR1 format`

:ACQuire:SEGmented:INDEX

N (see [page 798](#))

Command Syntax :ACQuire:SEGmented:INDEX <index>
 <index> ::= an integer from 1 to 25 (w/100K memory) in NR1 format

NOTE This command is available when the segmented memory option (Option SGM) is enabled.

The :ACQuire:SEGmented:INDEX command sets the index into the memory segments that have been acquired.

The segmented memory acquisition mode is enabled with the :ACQuire:MODE command. The number of segments to acquire is set using the :ACQuire:SEGmented:COUNt command, and data is acquired using the :DIGitize, :SINGle, or :RUN commands. The number of memory segments that have been acquired is returned by the :WAVeform:SEGmented:COUNt? query. The time tag of the currently indexed memory segment is returned by the :WAVeform:SEGmented:TTAG? query.

The maximum number of segments may be limited by the memory depth of your oscilloscope. For example, an oscilloscope with 100K memory allows a maximum of 25 segments.

Query Syntax :ACQuire:SEGmented:INDEX?

The :ACQuire:SEGmented:INDEX? query returns the current segmented memory index setting.

:ACQuire:SRATE

N (see [page 798](#))

The :ACQuire:SRATE? query returns the current oscilloscope acquisition sample rate. The sample rate is not directly controllable.

Return Format <sample_rate><NL>

<sample_rate> ::= sample rate in NR3 format

:ACQuire:TYPE

C (see [page 798](#))

Command Syntax :ACQuire:TYPE <type>

<type> ::= {NORMAL | AVERage | HRESolution | PEAK}

The :ACQuire:TYPE command selects the type of data acquisition that is to take place. The acquisition types are:

- NORMAL – sets the oscilloscope in the normal mode.
- AVERage – sets the oscilloscope in the averaging mode. You can set the count by sending the :ACQuire:COUNt command followed by the number of averages. In this mode, the value for averages is an integer from 1 to 65536. The COUNt value determines the number of averages that must be acquired.

The AVERage type is not available when in segmented memory mode (:ACQuire:MODE SEGmented).

- HRESolution – sets the oscilloscope in the high-resolution mode (also known as *smoothing*). This mode is used to reduce noise at slower sweep speeds where the digitizer samples faster than needed to fill memory for the displayed time range.

For example, if the digitizer samples at 200 MSa/s, but the effective sample rate is 1 MSa/s (because of a slower sweep speed), only 1 out of every 200 samples needs to be stored. Instead of storing one sample (and throwing others away), the 200 samples are averaged together to provide the value for one display point. The slower the sweep speed, the greater the number of samples that are averaged together for each display point.

- PEAK – sets the oscilloscope in the peak detect mode. In this mode, :ACQuire:COUNt has no meaning.

The AVERage and HRESolution types can give you extra bits of vertical resolution. See the *User's Guide* for an explanation. When getting waveform data acquired using the AVERage and HRESolution types, be sure to use the WORD or ASCII waveform data formats to get the extra bits of vertical resolution.

NOTE

The obsolete command ACQuire:TYPE:REALtime is functionally equivalent to sending ACQuire:MODE RTIME; TYPE NORMAL.

Query Syntax :ACQuire:TYPE?

The :ACQuire:TYPE? query returns the current acquisition type.

Return Format <acq_type><NL>

<acq_type> ::= {NORM | AVER | HRES | PEAK}

Introduction to
:BUS<n>
Commands

<n> ::= {1 | 2}

The BUS subsystem commands control the viewing, labeling, and digital channel makeup of two possible buses.

NOTE

These commands are only valid for the MSO models.

Reporting the Setup

Use :BUS<n>? to query setup information for the BUS subsystem.

Return Format

```
:BUS1:DISP 0;LAB "BUS1";MASK +255
```

:BUS<n>:BIT<m>

**Introduction to
:CHANnel<n>
Commands**

<n> ::= 1 to (# analog channels) in NR1 format

The CHANnel<n> subsystem commands control an analog channel (vertical or Y-axis of the oscilloscope). Channels are independently programmable for all offset, probe, coupling, bandwidth limit, inversion, vernier, and range (scale) functions. The channel number (1, 2, 3, or 4) specified in the command selects the analog channel that is affected by the command.

A label command provides identifying annotations of up to 10 characters.

You can toggle the channel displays on and off with the :CHANnel<n>:DISPlay command as well as with the root level commands :VIEW and :BLANK.

NOTE

The obsolete CHANnel subsystem is supported.

Reporting the Setup

Use :CHANnel1?, :CHANnel2?, :CHANnel3? or :CHANnel4? to query setup information for the CHANnel<n> subsystem.

Return Format

The following are sample responses from the :CHANnel<n>? query. In this case, the query was issued following a *RST command.

```
:CHAN1:RANG +40.0E+00;OFFS +0.00000E+00;COUP DC;IMP ONEM;DISP 1;BWL 0;
INV 0;LAB "1";UNIT VOLT;PROB +10E+00;PROB:SKEW +0.00E+00;STYP SING
```

:CHANnel<n>:BANDwidth

N (see [page 798](#))

Command Syntax `:CHANnel<n>:BANDwidth <limit>`

`<limit> ::= 25E6 in NR3 format`

`<n> ::= 1 to (# analog channels) in NR1 format`

The `:CHANnel<n>:BANDwidth` command sets the bandwidth limit value and turns on bandwidth limiting (see the `:CHANnel<n>:BWLimit` command).

For waveforms with frequencies below the bandwidth limit, turning the bandwidth limit on removes unwanted high frequency noise from the waveform.

Bandwidth limit also limits the trigger signal path of the channel.

While you can request any limit; the oscilloscope will choose the only bandwidth limit available, 25 MHz.

Query Syntax `:CHANnel<n>:BANDwidth? [MAXimum]`

The `:CHANnel<n>:BANDwidth?` query returns the current setting of the low-pass filter.

If the bandwidth limit is off, the query returns the full bandwidth of the oscilloscope.

When the MAXimum parameter is used, the oscilloscope's maximum possible bandwidth is returned.

Return Format `<limit><NL>`

`<limit> ::= 25E6 or full bandwidth in NR3 format`

See Also · [":CHANnel<n>:BWLimit"](#) on page 221

It changes the reference constants for scaling the display factors, for making automatic measurements, and for setting trigger levels.

Query Syntax `:CHANnel<n>:PROBe?`

The :CHANnel<n>:PROBe? query returns the current probe attenuation factor for the selected channel.

<skew value> ::= skew time in NR3 format

<skew value> ::= -100 ns to +100 ns

<n> ::= 1 to (# analog channels) in NR1 format

The :CHANnel<n>:PROBe:SKEW command sets the channel-to-channel skew factor for the specified channel. Each analog channel can be adjusted + or -100 ns for a total of 200 ns difference between channels. You can use the oscilloscope's probe skew control to remove cable-delay errors between channels.

Return Format <skew value><NL>

<skew value> ::= skew value in NR3 format

:CHANnel<n>:PROBe:STYPe

C (see [page 798](#))

Command Syntax

```
:CHANnel<n>:PROBe:STYPe <signal type>
<signal type> ::= {DIFFerential | SINGle}
<n> ::= 1 to (# analog channels) in NR1 format
```

The :CHANnel<n>:PROBe:STYPe command sets the channel probe signal type (STYPe) to differential or single-ended when using the 113xA Series probes and determines how offset is applied.

When single-ended is selected, the :CHANnel<n>:OFFset command changes the offset value of the probe amplifier. When differential is selected, the :CHANnel<n>:OFFset command changes the offset value of the channel amplifier.

Query Syntax

```
:CHANnel<n>:PROBe:STYPe?
```

The :CHANnel<n>:PROBe:STYPe? query returns the current probe signal type setting for the selected channel.

Return Format

:CHANnel<n>:PROTection

N (see [page 798](#))

Command Syntax :CHANnel<n>:PROTection[:CLEAR]

<n> ::= 1 to (# analog channels) in NR1 format | 4}

With the 2000 X-Series oscilloscopes, the analog channel input impedance is always $1\text{ M}\Omega$, so automatic overvoltage protection is not necessary (as it is for channels with 50Ω input impedance). There are no protection settings to clear, so the :CHANnel<n>:PROTection[:CLEAR] command does nothing.

Query Syntax :CHANnel<n>:PROTection?

The :CHANnel<n>:PROTection query always returns NORM (normal).

Return Format NORM<NL>

:DISPlay:ANAnnotation:TEXT

N (see [page 798](#))

Command Syntax `:DISPlay:ANAnnotation:TEXT <string>`

`<string>` ::= quoted ASCII string (up to 254 characters)

The :DISPlay:ANAnnotation:TEXT command specifies the annotation string. The annotation string can contain as many characters as will fit in the Edit Annotation box on the oscilloscope's screen, up to 254 characters.

You can include a carriage return in the annotation string using the characters "\n". Note that this is not a new line character but the actual "\\" (backslash) and "n" characters in the string. Carriage returns lessen the number of characters available for the annotation string.

Use :DISPlay:ANAnnotation:TEXT "" to remotely clear the annotation text. (Two sets of quote marks without a space between them creates a NULL string.)

Query Syntax `:DISPlay:ANAnnotation:TEXT?`

The :DISPlay:ANAnnotation:TEXT? query returns the specified annotation text.

When carriage returns are present in the annotation text, they are returned as the actual carriage return character (ASCII 0x0D).

Return Format `<string><NL>`

`<string>` ::= quoted ASCII string

:DISPlay:DATA

N (see [page 798](#))

Query Syntax	<code>:DISPlay:DATA? [<format> [,] [<palette>]</code>
	<code><format> ::= {BMP BMP8bit PNG}</code>
	<code><palette> ::= {COLor GRAYscale}</code>

The :DISPlay:DATA? query reads screen image data. You can choose 24-bit BMP, 8-bit BMP8bit, or 24-bit PNG formats in color or grayscale.

Note that the returned image is also affected by the :HARDcopy:INKSaver command, which is ON by default and returns an inverted image. To get a non-inverted image, send the ":HARDcopy:INKSaver OFF" command before the DATA? query.

If no format or palette option is specified, the screen image is returned in whatever image format is selected by the front panel's **[Save/Recall] > Save > Format** softkey. If the **Format** softkey does not select an image format (in other words, it selects a setup or data format), the BMP, COLor format is used.

Screen image data is returned in the IEEE-488.2 # binary block data format.

Return Format	<code><display data><NL></code>
	<code><display data> ::= binary block data in IEEE-488.2 # format.</code>

Command Syntax	<code>:EXTernal:PROBe <attenuation></code>
	<code><attenuation> ::= probe attenuation ratio in NR3 format</code>
	The :EXTernal:PROBe command specifies the probe attenuation factor for the external trigger. The probe attenuation factor may be 0.1 to 10000. This command does not change the actual input sensitivity of the oscilloscope. It changes the reference constants for scaling the display factors and for setting trigger levels.

Introduction to :FUNCTION Commands The FUNCTION subsystem controls the math functions in the oscilloscope. Add, subtract, multiply, and FFT (Fast Fourier Transform) operations are available. These math operations only use the analog (vertical) channels.

The SOURce1, DISPlay, RANGE, and OFFSet commands apply to any function.

The SPAN, CENTER, VTYPE, and WINDOW commands are only useful for FFT functions. When FFT is selected, the horizontal cursors change from time to frequency (Hz), and the vertical cursors change from volts to decibel (dB).

Reporting the Setup

Use :FUNCTION? to query setup information for the FUNCTION subsystem.

Return Format

The following is a sample response from the :FUNCTION? queries. In this case, the query was issued following a *RST command.

```
:FUNC:OPER ADD;DISP 0;SOUR1 CHAN1;SOUR2 CHAN2;RANG +8.00E+00;OFFS  
+0.0E+00;:FUNC:GOFT:OPER ADD;SOUR1 CHAN1;SOUR2 CHAN2
```

:FUNCTION[:FFT]:WINDOW

N (see [page 798](#))

Command Syntax `:FUNCTION[:FFT]:WINDOW <window>`
`<window> ::= {RECTangular | HANNing | FLATtop | BHARris}`

The :FUNCTION[:FFT]:WINDOW command allows the selection of four different windowing transforms or operations for the FFT (Fast Fourier Transform) function.

The FFT operation assumes that the time record repeats. Unless an integral number of sampled waveform cycles exist in the record, a discontinuity is created between the end of one record and the beginning of the next. This discontinuity introduces additional frequency components about the peaks into the spectrum. This is referred to as leakage. To minimize leakage, windows that approach zero smoothly at the start and end of the record are employed as filters to the FFTs. Each window is useful for certain classes of input signals.

- RECTangular – useful for transient signals, and signals where there are an integral number of cycles in the time record.
- HANNing – useful for frequency resolution and general purpose use. It is good for resolving two frequencies that are close together, or for making frequency measurements. This is the default window.
- FLATtop – best for making accurate amplitude measurements of frequency peaks.
- BHARris (Blackman-Harris) – reduces time resolution compared to the rectangular window, but it improves the capacity to detect smaller impulses due to lower secondary lobes (provides minimal spectral leakage).

Query Syntax `:FUNCTION[:FFT]:WINDOW?`

The :FUNCTION[:FFT]:WINDOW? query returns the value of the window selected for the FFT function.

Return Format `<window><NL>`
`<window> ::= {RECT | HANN | FLAT | BHAR}`

- MULTIply – Source1 * source2.
- FFT – Fast Fourier Transform on the selected waveform source.

When the operation is ADD, SUBTract, or MULTIply, the :FUNCTION:SOURce1 and :FUNCTION:SOURce2 commands are used to select source1 and source2. For FFT, the :FUNCTION:SOURce1 command selects the waveform source.

Query Syntax `:FUNCTION:OPERation?`

The :FUNCTION:OPERation? query returns the current operation for the selected function.

<n> ::= {1 | 2 | 3 | 4} for 4ch models
<n> ::= {1 | 2} for 2ch models
```

The :FUNCTION:SOURce1 command is used for any :FUNCTION:OPERation selection (including the ADD, SUBTract, or MULTiply channel math operations and the FFT transform). This command selects the first source for channel math operations or the single source for the transforms.

The GOFT parameter is only available for the FFT function. It lets you specify, as the function input source, the addition, subtraction, or multiplication of two channels. When GOFT is used, the g(t) source is specified by the :FUNCTION:GOFT:OPERation, :FUNCTION:GOFT:SOURce1, and :FUNCTION:GOFT:SOURce2 commands.

NOTE

Another shorthand notation for SOURce1 in this command/query (besides SOUR1) is SOUR.

```
<value> ::= {CHAN<n> | GOFT}
<n> ::= {1 | 2 | 3 | 4} for 4ch models
<n> ::= {1 | 2} for 2ch models

<n> ::= {{1 | 2} | {3 | 4}} for 4ch models, depending on SOURCE1
      selection
<n> ::= {1 | 2} for 2ch models
```

The :FUNCTION:SOURce2 command specifies the second source for math operations that have two sources (see the :FUNCTION:OPERation command), in other words, ADD, SUBTract, or MULTiply. (The :FUNCTION:SOURce1 command specifies the first source.)

If CHANnel1 or CHANnel2 is selected for :FUNCTION:SOURce1, the SOURce2 selection can be CHANnel1 or CHANnel2. Likewise, if CHANnel3 or CHANnel4 is selected for :FUNCTION:SOURce1, the SOURce2 selection can be CHANnel3 or CHANnel4.

The :FUNCTION:SOURce2 setting is not used when the :FUNCTION:OPERation is FFT (Fast Fourier Transform).

Return Format

```
<value><NL>
<value> ::= {CHAN<n> | NONE}

Introduction to :MARKer Commands The MARKer subsystem commands set and query the settings of X-axis markers (X1 and X2 cursors) and the Y-axis markers (Y1 and Y2 cursors). You can set and query the marker mode and source, the position of the X and Y cursors, and query delta X and delta Y cursor values.

Reporting the Setup

Use :MARKer? to query setup information for the MARKer subsystem.

Return Format

The following is a sample response from the :MARKer? query. In this case, the query was issued following a *RST and ":MARKer:MODE MANual" command.

```
:MARK:X1Y1 CHAN1;X2Y2 CHAN1;MODE MAN
```

:MARKer:MODE

N (see [page 798](#))

Command Syntax `:MARKer:MODE <mode>`

`<mode> ::= {OFF | MEASurement | MANual | WAVEform}`

The :MARKer:MODE command sets the cursors mode:

- OFF – removes the cursor information from the display.
- MANual – enables manual placement of the X and Y cursors.

If the front-panel cursors are off, or are set to the front-panel Hex or Binary mode, setting :MARKer:MODE MANual will put the cursors in the front-panel Normal mode.

- MEASurement – cursors track the most recent measurement.

Setting the mode to MEASurement sets the marker sources (:MARKer:X1Y1source and :MARKer:X2Y2source) to the measurement source (:MEASure:SOURce). Setting the measurement source remotely always sets the marker sources.

- WAVEform – the Y1 cursor tracks the voltage value at the X1 cursor of the waveform specified by the X1Y1source, and the Y2 cursor does the same for the X2 cursor and its X2Y2source.

Query Syntax `:MARKer:MODE?`

The :MARKer:MODE? query returns the current cursors mode.

Return Format `<mode><NL>`

`<mode> ::= {OFF | MEAS | MAN | WAV}`

:MARKer:X1Position

N (see [page 798](#))

- Command Syntax**
- ```
:MARKer:X1Position <position> [suffix]
<position> ::= X1 cursor position in NR3 format
<suffix> ::= {s | ms | us | ns | ps | Hz | kHz | MHz}
```
- The :MARKer:X1Position command:
- Sets :MARKer:MODE to MANual if it is not currently set to WAVeform (see "[:MARKer:MODE](#)" on page 323).
  - Sets the X1 cursor position to the specified value.
- X cursor units are set by the :MARKer:XUNits command.

**NOTE**

:MARKer:X1Position is an overlapped command (see "[Sequential vs. Overlapped Commands](#)" on page 806).

---

**Query Syntax**

:MARKer:X1Position?

The :MARKer:X1Position? query returns the current X1 cursor position. This is functionally equivalent to the obsolete :MEASure:TSTArt command/query.

**NOTE**

If the front-panel cursors are off, the marker position values are not defined and an error is generated. Make sure to set :MARKer:MODE to MANual or WAVeform to put the cursors in the front-panel Normal mode.

---

**Return Format**

```
<position><NL>
<position> ::= X1 cursor position in NR3 format
```

## :MARKer:X1Y1source

**N** (see [page 798](#))

### Command Syntax

```
:MARKer:X1Y1source <source>
<source> ::= {CHANnel<n> | FUNCtion | MATH | WMEMory<r>}
<n> ::= 1 to (# analog channels) in NR1 format
<r> ::= {1 | 2}
```

The :MARKer:X1Y1source command sets the source for the cursors. The channel you specify must be enabled for cursors to be displayed. If the channel or function is not on, an error message is issued.

If the marker mode is not currently WAVEform (see "[:MARKer:MODE](#)" on page 323):

- Sending a :MARKer:X1Y1source command will put the cursors in the MANual mode.
- Setting the source for one pair of markers (for example, X1Y1) sets the source for the other (for example, X2Y2).

If the marker mode is currently WAVEform, the X1Y1 source can be set separate from the X2Y2 source.

If :MARKer:MODE is set to OFF or MANUAL, setting :MEASure:SOURce to CHANnel<n>, FUNCtion, MATH, or WMEMory<r> will also set :MARKer:X1Y1source and :MARKer:X2Y2source to this value.

### NOTE

MATH is an alias for FUNCtion. The query will return FUNC if the source is FUNCtion or MATH.

### Query Syntax

```
:MARKer:X1Y1source?
```

The :MARKer:X1Y1source? query returns the current source for the cursors. If all channels are off or if :MARKer:MODE is set to OFF, the query returns NONE.

### Return Format

```
<source><NL>
<source> ::= {CHAN<n> | FUNC | WMEM<r> | NONE}
```

NOTE

:MARKer:X2Position is an overlapped command (see "[Sequential vs. Overlapped Commands](#)" on page 806).

Query Syntax

:MARKer:X2Position?

The :MARKer:X2Position? query returns current X2 cursor position. This is functionally equivalent to the obsolete :MEASure:TSTOp command/query.

NOTE

If the front-panel cursors are off, the marker position values are not defined and an error is generated. Make sure to set :MARKer:MODE to MANual or WAVEform to put the cursors in the front-panel Normal mode.

Return Format

```
<position><NL>
<position> ::= X2 cursor position in NR3 format
```

N (see [page 798](#))

Command Syntax

```
:MARKer:X2Y2source <source>
<source> ::= {CHANnel<n> | FUNCtion | MATH | WMEMory<r>}
<n> ::= 1 to (# analog channels) in NR1 format
<r> ::= {1 | 2}
```

The :MARKer:X2Y2source command sets the source for the cursors. The channel you specify must be enabled for cursors to be displayed. If the channel or function is not on, an error message is issued.

If the marker mode is not currently WAVEform (see "[:MARKer:MODE](#)" on page 323):

- Sending a :MARKer:X2Y2source command will put the cursors in the MANual mode.
- Setting the source for one pair of markers (for example, X2Y2) sets the source for the other (for example, X1Y1).

If the marker mode is currently WAVEform, the X2Y2 source can be set separate from the X1Y1 source.

If :MARKer:MODE is set to OFF or MANUAL, setting :MEASure:SOURce to CHANnel<n>, FUNCtion, MATH, or WMEMory<r> will also set :MARKer:X1Y1source and :MARKer:X2Y2source to this value.

NOTE

MATH is an alias for FUNCtion. The query will return FUNC if the source is FUNCtion or MATH.

Query Syntax

```
:MARKer:X2Y2source?
```

The :MARKer:X2Y2source? query returns the current source for the cursors. If all channels are off or if :MARKer:MODE is set to OFF, the query returns NONE.

Return Format

```
<source><NL>
<source> ::= {CHAN<n> | FUNC | WMEM<r> | NONE}
```

Xdelta = (Value at X2 cursor) - (Value at X1 cursor)

X cursor units are set by the :MARKer:XUNits command.

NOTE

If the front-panel cursors are off, the marker position values are not defined. Make sure to set :MARKer:MODE to MANual or WAVEform to put the cursors in the front-panel Normal mode.

Return Format `<value><NL>`

`<value>` ::= difference value in NR3 format.

:MARKer:XUNits

N (see [page 798](#))

Command Syntax `:MARKer:XUNits <units>`

`<units> ::= {SEConds | HERTz | DEGRees | PERCent}`

The :MARKer:XUNits command sets the X cursors units:

- SEConds – for making time measurements.
- HERTz – for making frequency measurements.
- DEGRees – for making phase measurements. Use the :MARKer:XUNits:USE command to set the current X1 location as 0 degrees and the current X2 location as 360 degrees.
- PERCent – for making ratio measurements. Use the :MARKer:XUNits:USE command to set the current X1 location as 0 percent and the current X2 location as 100 percent.

Changing X units affects the input and output values of the :MARKer:X1Position, :MARKer:X2Position, and :MARKer:XDELta commands/queries.

Query Syntax `:MARKer:XUNits?`

The :MARKer:XUNits? query returns the current X cursors units.

:MARKer:XUNits:USE

N (see [page 798](#))

Command Syntax `:MARKer:XUNits:USE`

When DEGRees is selected for :MARKer:XUNits, the :MARKer:XUNits:USE command sets the current X1 location as 0 degrees and the current X2 location as 360 degrees.

When PERCent is selected for :MARKer:XUNits, the :MARKer:XUNits:USE command sets the current X1 location as 0 percent and the current X2 location as 100 percent.

Once the 0 and 360 degree or 0 and 100 percent locations are set, inputs to and outputs from the :MARKer:X1Position, :MARKer:X2Position, and :MARKer:XDELta commands/queries are relative to the set locations.

$$\text{Ydelta} = (\text{Value at Y2 cursor}) - (\text{Value at Y1 cursor})$$

NOTE

If the front-panel cursors are off or are set to Binary or Hex Mode, the marker position values are not defined. Make sure to set `:MARKer:MODE` to MANual or WAveform to put the cursors in the front-panel Normal mode.

Command Syntax `:MARKer:YUNits <units>`

`<units> ::= {BASE | PERCent}`

The :MARKer:YUNits command sets the Y cursors units:

- BASE – for making measurements in the units associated with the cursors source.
- PERCent – for making ratio measurements. Use the :MARKer:YUNits:USE command to set the current Y1 location as 0 percent and the current Y2 location as 100 percent.

Changing Y units affects the input and output values of the :MARKer:Y1Position, :MARKer:Y2Position, and :MARKer:YDELta commands/queries.

Introduction to :MEASure Commands The commands in the MEASure subsystem are used to make parametric measurements on displayed waveforms.

Measurement Setup

To make a measurement, the portion of the waveform required for that measurement must be displayed on the oscilloscope screen.

Measurement Type	Portion of waveform that must be displayed
period, duty cycle, or frequency	at least one complete cycle
pulse width	the entire pulse
rise time	rising edge, top and bottom of pulse
fall time	falling edge, top and bottom of pulse

Measurement Error

If a measurement cannot be made (typically because the proper portion of the waveform is not displayed), the value +9.9E+37 is returned for that measurement.

Making Measurements

If more than one waveform, edge, or pulse is displayed, time measurements are made on the portion of the displayed waveform closest to the trigger reference (left, center, or right).

When making measurements in the zoomed (delayed) time base mode (:TIMEbase:MODE WINDOW), the oscilloscope will attempt to make the measurement inside the zoomed sweep window. If the measurement is an average and there are not three edges, the oscilloscope will revert to the mode of making the measurement at the start of the main sweep.

When the command form is used, the measurement result is displayed on the instrument. When the query form of these measurements is used, the measurement is made one time, and the measurement result is returned over the bus.

Measurements are made on the displayed waveforms specified by the :MEASure:SOURce command. The MATH source is an alias for the FUNCtion source.

Not all measurements are available on the digital channels or FFT (Fast Fourier Transform).

Reporting the Setup

Use the :MEASure? query to obtain setup information for the MEASure subsystem. (Currently, this is only :MEASure:SOURce.)

Return Format

The following is a sample response from the :MEASure? query. In this case, the query was issued following a *RST command.

```
:MEAS:SOUR CHAN1,CHAN2;STAT ON
```

:MEASure:ALL

N (see [page 798](#))

Command Syntax :MEASure:ALL

This command installs a Snapshot All measurement on the screen.

See Also · ["Introduction to :MEASure Commands"](#) on page 347

:MEASure:CLEar

N (see [page 798](#))

Command Syntax `:MEASure:CLEar`

This command clears all selected measurements and markers from the screen.

See Also · ["Introduction to :MEASure Commands"](#) on page 347

:MEASure:DEFine

N (see [page 798](#))

Command Syntax

```
:MEASure:DEFine <meas_spec>[,<source>]
<meas_spec> ::= {DElay | THResholds}
<source> ::= {CHANnel<n> | FUNCtion | MATH | WMEMory<r>}
<n> ::= 1 to (# analog channels) in NR1 format
<r> ::= {1 | 2}
```

The :MEASure:DEFine command sets up the definition for measurements by specifying the delta time or threshold values. Changing these values may affect the results of other measure commands. The table below identifies which measurement results that can be affected by redefining the DElay specification or the THResholds values. For example, changing the THResholds definition from the default 10%, 50%, and 90% values may change the returned measurement result.

MEASure Command	DElay	THResholds
DUTYcycle		x
DElay	x	x
FALLtime		x
FREQency		x
NWIDth		x
OVERshoot		x
PERiod		x
PHASE		x
PRESHoot		x
PWIDth		x
RISetime		x
VAVerage		x
VRMS		x

:MEASure:DEFine DElay Command Syntax

```
:MEASure:DEFine DELay,<delay spec>[,<source>]
<delay spec> ::= <edge_spec1>,<edge_spec2>
<edge_spec1> ::= [<slope>]<occurrence>
<edge_spec2> ::= [<slope>]<occurrence>
<slope> ::= {+ | -}
```

```
<occurrence> ::= integer
```

This command defines the behavior of the :MEASure:DElay? query by specifying the start and stop edge to be used. <edge_spec1> specifies the slope and edge number on source1. <edge_spec2> specifies the slope and edge number on source2. The measurement is taken as:

$$\text{delay} = t(\text{edge_spec2}) - t(\text{edge_spec1})$$

NOTE

The :MEASure:DElay command and the front-panel delay measurement use an auto-edge selection method to determine the actual edge used for the measurement. The :MEASure:DEFine command has no effect on these delay measurements. The edges specified by the :MEASure:DEFine command only define the edges used by the :MEASure:DElay? query.

:MEASure:DEFine THresholds Command Syntax

```
:MEASure:DEFine THresholds,<threshold spec>[,<source>]
<threshold spec> ::= {STANDARD
                      | {<threshold mode>,<upper>,<middle>,<lower>}}
<threshold mode> ::= {PERCENT | ABSOLUTE}
for <threshold mode> = PERCENT:
<upper>,<middle>,<lower> ::= A number specifying the upper, middle,
                                and lower threshold percentage values
                                between Vbase and Vtop in NR3 format.
```

for <threshold mode> = ABSOLUTE:

```
<upper>,<middle>,<lower> ::= A number specifying the upper, middle,
                                and lower threshold absolute values in
                                NR3 format.
```

- STANDARD threshold specification sets the lower, middle, and upper measurement thresholds to 10%, 50%, and 90% values between Vbase and Vtop.
- Threshold mode PERCENT sets the measurement thresholds to any user-defined percentages between 5% and 95% of values between Vbase and Vtop.
- Threshold mode ABSOLUTE sets the measurement thresholds to absolute values. ABSOLUTE thresholds are dependent on channel scaling (:CHANnel<n>:RANGE or "[:CHANnel<n>:SCALe](#)" on page 235:CHANnel<n>:SCALE), probe attenuation (:CHANnel<n>:PROBe), and probe units (:CHANnel<n>:UNITS). Always set these values first before setting ABSOLUTE thresholds.

Query Syntax

```
:MEASure:DEFine? <meas_spec>[,<source>]
<meas_spec> ::= {DElay | THresholds}
```

The :MEASure:DEFine? query returns the current edge specification for the delay measurements setup or the current specification for the thresholds setup.

Return Format

for <meas_spec> = DElay:

{ <edge_spec1> | <edge_spec2> | <edge_spec1>,<edge_spec2>} <NL>
 for <meas_spec> = THresholds and <threshold mode> = PERCent:
 THR,PERC,<upper>,<middle>,<lower><NL>
 <upper>, <middle>, <lower> ::= A number specifying the upper, middle,
 and lower threshold percentage values
 between Vbase and Vtop in NR3 format.

for <meas_spec> = THresholds and <threshold mode> = ABSolute:

THR,ABS,<upper>,<middle>,<lower><NL>
 <upper>, <middle>, <lower> ::= A number specifying the upper, middle,
 and lower threshold voltages in NR3
 format.

for <threshold spec> = STAndard:

THR,PERC,+90.0,+50.0,+10.0

:MEASure:DElay

N (see [page 798](#))

Command Syntax

```
:MEASure:DElay [<source1> [, <source2>]
<source1>, <source2> ::= {CHANnel<n> | FUNCTion | MATH | WMEMORY<r>}
<n> ::= 1 to (# analog channels) in NR1 format
<r> ::= 1-2 in NR1 format
```

The :MEASure:DElay command places the instrument in the continuous measurement mode and starts a delay measurement.

The measurement is taken as:

$$\text{delay} = t(\text{edge spec 2}) - t(\text{edge spec 1})$$

where the <edge spec> definitions are set by the :MEASure:DEFine command

NOTE

The :MEASure:DElay command and the front-panel delay measurement differ from the :MEASure:DElay? query.

The delay command or front-panel measurement run the delay measurement in auto-edge select mode. In this mode, you can select the edge polarity, but the instrument will select the edges that will make the best possible delay measurement. The source1 edge chosen will be the edge that meets the polarity specified and is closest to the timebase reference point. The source2 edge selected will be that edge of the specified polarity that gives the first of the following criteria:

- The smallest positive delay value that is less than source1 period.
- The smallest negative delay that is less than source1 period.
- The smallest absolute value of delay.

The :MEASure:DElay? query will make the measurement using the edges specified by the :MEASure:DEFine command.

Query Syntax

:MEASure:DElay? [<source1> [, <source2>]

The :MEASure:DElay? query measures and returns the delay between source1 and source2. The delay measurement is made from the user-defined slope and edge count of the signal connected to source1, to the defined slope and edge count of the signal connected to source2. Delay measurement slope and edge parameters are selected using the :MEASure:DEFine command.

Also in the :MEASure:DEFine command, you can set upper, middle, and lower threshold values. *It is the middle threshold value that is used when performing the delay query.* The standard upper, middle, and lower measurement thresholds are

90%, 50%, and 10% values between Vbase and Vtop. If you want to move the delay measurement point nearer to Vtop or Vbase, you must change the threshold values with the :MEASure:DEFine THresholds command.

Return Format	<value><NL> <value> ::= floating-point number delay time in seconds in NR3 format

:MEASure:DUTYcycle

C (see [page 798](#))

Command Syntax

```
:MEASure:DUTYcycle [<source>]
<source> ::= {<digital channels> | CHANnel<n> | FUNCtion | MATH
              | WMEMory<r>}
<digital channels> ::= DIGItal<d> for the MSO models
<n> ::= 1 to (# of analog channels) in NR1 format
<r> ::= 1-2 in NR1 format
<d> ::= 0 to (# digital channels - 1) in NR1 format
```

The :MEASure:DUTYcycle command installs a screen measurement and starts a duty cycle measurement on the current :MEASure:SOURce. If the optional source parameter is specified, the current source is modified.

NOTE

The signal must be displayed to make the measurement. This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax

```
:MEASure:DUTYcycle? [<source>]
```

The :MEASure:DUTYcycle? query measures and outputs the duty cycle of the signal specified by the :MEASure:SOURce command. The value returned for the duty cycle is the ratio of the positive pulse width to the period. The positive pulse width and the period of the specified signal are measured, then the duty cycle is calculated with the following formula:

$$\text{duty cycle} = (+\text{pulse width}/\text{period}) * 100$$

Return Format

```
<value><NL>
<value> ::= ratio of positive pulse width to period in NR3 format
```

:MEASure:FALLtime

C (see [page 798](#))

Command Syntax `:MEASure:FALLtime [<source>]`

```
<source> ::= {CHANnel<n> | FUNCtion | MATH | WMEMORY<r>}
<n> ::= 1 to (# analog channels) in NR1 format
<r> ::= 1-2 in NR1 format
```

The :MEASure:FALLtime command installs a screen measurement and starts a fall-time measurement. For highest measurement accuracy, set the sweep speed as fast as possible, while leaving the falling edge of the waveform on the display. If the optional source parameter is specified, the current source is modified.

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax `:MEASure:FALLtime? [<source>]`

The :MEASure:FALLtime? query measures and outputs the fall time of the displayed falling (negative-going) edge closest to the trigger reference. The fall time is determined by measuring the time at the upper threshold of the falling edge, then measuring the time at the lower threshold of the falling edge, and calculating the fall time with the following formula:

$$\text{fall time} = \text{time at lower threshold} - \text{time at upper threshold}$$

Return Format `<value><NL>`

```
<value> ::= time in seconds between the lower threshold and upper
threshold in NR3 format
```

:MEASure:FREQuency

C (see [page 798](#))

Command Syntax

```
:MEASure:FREQuency [<source>]
<source> ::= {<digital channels> | CHANnel<n> | FUNCTion | MATH
              | WMEMory<r>}
<digital channels> ::= DIGItal<d> for the MSO models
<n> ::= 1 to (# of analog channels) in NR1 format
<r> ::= 1-2 in NR1 format
<d> ::= 0 to (# digital channels - 1) in NR1 format
```

The :MEASure:FREQuency command installs a screen measurement and starts a frequency measurement. If the optional source parameter is specified, the current source is modified.

IF the edge on the screen closest to the trigger reference is rising:

THEN frequency = 1/(time at trailing rising edge - time at leading rising edge)

ELSE frequency = 1/(time at trailing falling edge - time at leading falling edge)

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax

:MEASure:FREQuency? [<source>]

The :MEASure:FREQuency? query measures and outputs the frequency of the cycle on the screen closest to the trigger reference.

Return Format

<source><NL>
<source> ::= frequency in Hertz in NR3 format

:MEASure:NWIDth

C (see [page 798](#))

Command Syntax

```
:MEASure:NWIDth [<source>]
<source> ::= {<digital channels> | CHANnel<n> | FUNCtion | MATH
              | WMEMory<r>}

<n> ::= 1 to (# of analog channels) in NR1 format
<r> ::= 1-2 in NR1 format
<d> ::= 0 to (# digital channels - 1) in NR1 format
```

The :MEASure:NWIDth command installs a screen measurement and starts a negative pulse width measurement. If the optional source parameter is not specified, the current source is modified.

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax

```
:MEASure:NWIDth? [<source>]
```

The :MEASure:NWIDth? query measures and outputs the width of the negative pulse on the screen closest to the trigger reference using the midpoint between the upper and lower thresholds.

FOR the negative pulse closest to the trigger point:

width = (time at trailing rising edge - time at leading falling edge)

Return Format

```
<value><NL>
<value> ::= negative pulse width in seconds in NR3 format

:MEASure:OVERshoot

C (see [page 798](#))

Command Syntax

```
:MEASure:OVERshoot [<source>]
<source> ::= {CHANnel<n> | FUNCtion | MATH | WMEMORY<r>}
<n> ::= 1 to (# analog channels) in NR1 format
<r> ::= 1-2 in NR1 format
```

The :MEASure:OVERshoot command installs a screen measurement and starts an overshoot measurement. If the optional source parameter is specified, the current source is modified.

NOTE

This command is not available if the source is FFT (Fast Fourier Transform).

Query Syntax

```
:MEASure:OVERshoot? [<source>]
```

The :MEASure:OVERshoot? query measures and returns the overshoot of the edge closest to the trigger reference, displayed on the screen. The method used to determine overshoot is to make three different vertical value measurements: Vtop, Vbase, and either Vmax or Vmin, depending on whether the edge is rising or falling.

For a rising edge:

$$\text{overshoot} = ((\text{Vmax}-\text{Vtop}) / (\text{Vtop}-\text{Vbase})) \times 100$$

For a falling edge:

$$\text{overshoot} = ((\text{Vbase}-\text{Vmin}) / (\text{Vtop}-\text{Vbase})) \times 100$$

Vtop and Vbase are taken from the normal histogram of all waveform vertical values. The extremum of Vmax or Vmin is taken from the waveform interval right after the chosen edge, halfway to the next edge. This more restricted definition is used instead of the normal one, because it is conceivable that a signal may have more preshoot than overshoot, and the normal extremum would then be dominated by the preshoot of the following edge.

Return Format

<overshoot><NL>

<overshoot> ::= the percent of the overshoot of the selected waveform in NR3 format

<n> ::= 1 to (# of analog channels) in NR1 format
<r> ::= 1-2 in NR1 format

Command Syntax `:MEASure:PHASe [<source1> [,<source2>]`

`<source1>, <source2> ::= {CHANnel<n> | FUNCTion | MATH | WMEMORY<r>}`

`<n> ::= 1 to (# analog channels) in NR1 format`

`<r> ::= 1-2 in NR1 format`

The :MEASure:PHASe command places the instrument in the continuous measurement mode and starts a phase measurement.

Query Syntax `:MEASure:PHASe? [<source1> [,<source2>]`

The :MEASure:PHASe? query measures and returns the phase between the specified sources.

A phase measurement is a combination of the period and delay measurements. First, the period is measured on source1. Then the delay is measured between source1 and source2. The edges used for delay are the source1 rising edge used for the period measurement closest to the horizontal reference and the rising edge on source 2. See :MEASure:DElay for more detail on selecting the 2nd edge.

The phase is calculated as follows:

$$\text{phase} = (\text{delay} / \text{period of input 1}) \times 360$$

Return Format `<value><NL>`

`<value> ::= the phase angle value in degrees in NR3 format`

C (see [page 798](#))

Command Syntax

```
:MEASure: RISetime [<source>]
<source> ::= {CHANnel<n> | FUNCtion | MATH | WMEMORY<r>}
<n> ::= 1 to (# analog channels) in NR1 format
<r> ::= 1-2 in NR1 format

Query Syntax

```
:MEASure: RISetime? [<source>]
```

The :MEASure:RISetime? query measures and outputs the rise time of the displayed rising (positive-going) edge closest to the trigger reference. For maximum measurement accuracy, set the sweep speed as fast as possible while leaving the leading edge of the waveform on the display. The rise time is determined by measuring the time at the lower threshold of the rising edge and the time at the upper threshold of the rising edge, then calculating the rise time with the following formula:

$$\text{rise time} = \text{time at upper threshold} - \text{time at lower threshold}$$

Return Format

Return Format `<show><NL>`

See Also • "Introduction to :MEASure Commands" on page 347

:MEASure:SOURce

C (see [page 798](#))

Command Syntax

```
:MEASure:SOURce <source1>[,<source2>]
<source1>,<source2> ::= {<digital channels> | CHANnel<n> | FUNCtion
                           | MATH | WMEMory<r> | EXternal}

<digital channels> ::= DIGItal<d> for the MSO models

<n> ::= 1 to (# of analog channels) in NR1 format

<r> ::= 1-2 in NR1 format

<d> ::= 0 to (# digital channels - 1) in NR1 format
```

The :MEASure:SOURce command sets the default sources for measurements. The specified sources are used as the sources for the MEASure subsystem commands if the sources are not explicitly set with the command.

If a source is specified for any measurement, the current source is changed to this new value.

If :MARKer:MODE is set to OFF or MANual, setting :MEASure:SOURce to CHANnel<n>, FUNCTION, or MATH will also set :MARKer:X1Y1source to source1 and :MARKer:X2Y2source to source2.

EXTernal is only a valid source for the counter measurement (and <source1>).

Query Syntax

The :MEASure:SOURce? query returns the current source selections. If source2 is not specified, the query returns "NONE" for source2. If all channels are off, the query returns "NONE,NONE". Source2 only applies to :MEASure:DELay and :MEASure:PHASe measurements.

NOTE

MATH is an alias for FUNCtion. The query will return FUNC if the source is FUNCtion or MATH.

Return Format

```
<source1>,<source2><NL>
<source1>,<source2> ::= {<digital channels> | CHAN<n> | FUNC | WMWM<r>

:MEASure:TEDGE

N (see [page 798](#))

Query Syntax `:MEASure:TEDGE? <slope><occurrence>[,<source>]`

`<slope>` ::= direction of the waveform. A rising slope is indicated by a space or plus sign (+). A falling edge is indicated by a minus sign (-).

`<occurrence>` ::= the transition to be reported. If the occurrence number is one, the first crossing from the left screen edge is reported. If the number is two, the second crossing is reported, etc.

`<source>` ::= {`<digital channels>` | `CHANnel<n>` | `FUNCTION` | `MATH` | `WMEMory<r>`}

`<digital channels>` ::= `DIGItal<d>` for the MSO models

`<n>` ::= 1 to (# of analog channels) in NR1 format

`<r>` ::= 1-2 in NR1 format

`<d>` ::= 0 to (# digital channels - 1) in NR1 format

When the :MEASure:TEDGE query is sent, the displayed signal is searched for the specified transition. The time interval between the trigger event and this occurrence is returned as the response to the query. The sign of the slope selects a rising (+) or falling (-) edge. If no sign is specified for the slope, it is assumed to be the rising edge.

The magnitude of occurrence defines the occurrence to be reported. For example, +3 returns the time for the third time the waveform crosses the midpoint threshold in the positive direction. Once this crossing is found, the oscilloscope reports the time at that crossing in seconds, with the trigger point (time zero) as the reference.

If the specified crossing cannot be found, the oscilloscope reports +9.9E+37. This value is returned if the waveform does not cross the specified vertical value, or if the waveform does not cross the specified vertical value for the specific number of times in the direction specified.

You can make delay and phase measurements using the MEASure:TEDGE command:

Delay = time at the nth rising or falling edge of the channel - time at the same edge of another channel

Phase = (delay between channels / period of channel) x 360

For an example of making a delay and phase measurement, see "[:MEASure:TEDGE Code](#)" on page 371.

If the optional source parameter is specified, the current source is modified.

NOTE

This query is not available if the source is FFT (Fast Fourier Transform).

Return Format

<value><NL>
<value> ::= time in seconds of the specified transition in NR3 format

:MEASure:TEDGE**Code**

:MEASure:TVALue

C (see [page 798](#))

Query Syntax `:MEASure:TVALue? <value>, [<slope>]<occurrence>[,<source>]`

`<value>` ::= the vertical value that the waveform must cross. The value can be volts or a math function value such as dB, Vs, or V/s.

`<slope>` ::= direction of the waveform. A rising slope is indicated by a plus sign (+). A falling edge is indicated by a minus sign (-).

`<occurrence>` ::= the transition to be reported. If the occurrence number is one, the first crossing is reported. If the number is two, the second crossing is reported, etc.

`<source>` ::= {CHANnel<n> | FUNCTion | MATH | WMEMory<r>}

`<n>` ::= 1 to (# analog channels) in NR1 format

`<r>` ::= 1-2 in NR1 format

When the :MEASure:TVALue? query is sent, the displayed signal is searched for the specified value level and transition. The time interval between the trigger event and this defined occurrence is returned as the response to the query.

The specified value can be negative or positive. To specify a negative value, use a minus sign (-). The sign of the slope selects a rising (+) or falling (-) edge. If no sign is specified for the slope, it is assumed to be the rising edge.

The magnitude of the occurrence defines the occurrence to be reported. For example, +3 returns the time for the third time the waveform crosses the specified value level in the positive direction. Once this value crossing is found, the oscilloscope reports the time at that crossing in seconds, with the trigger point (time zero) as the reference.

If the specified crossing cannot be found, the oscilloscope reports +9.9E+37. This value is returned if the waveform does not cross the specified value, or if the waveform does not cross the specified value for the specified number of times in the direction specified.

If the optional source parameter is specified, the current source is modified.

NOTE

This query is not available if the source is FFT (Fast Fourier Transform).

:MEASure:VTIMe

N (see [page 798](#))

Query Syntax

```
:MEASure:VTIMe? <vtimetime_argument>[,<source>]
<vtimetime_argument> ::= time from trigger in seconds
<source> ::= {<digital channels> | CHANnel<n> | FUNCtion | MATH
| WMEMory<r>}
<digital channels> ::= DIGItal<d> for the MSO models
<n> ::= 1 to (# of analog channels) in NR1 format
<r> ::= 1-2 in NR1 format
<d> ::= 0 to (# digital channels - 1) in NR1 format
```

The :MEASure:VTIMe? query returns the value at a specified time on the source specified with :MEASure:SOURce. The specified time must be on the screen and is referenced to the trigger event. If the optional source parameter is specified, the current source is modified.

NOTE

This query is not available if the source is FFT (Fast Fourier Transform).

Return Format

<value><NL>
<value> ::= value at the specified time in NR3 format
```

```
<source> ::= {CHANnel<n> | FUNCtion | MATH}
<n> ::= 1-2 or 1-4 (# of analog channels) in NR1 format
<r> ::= 1-2 in NR1 format

Introduction to :MTEST Commands Mask testing automatically compares the current displayed waveform with the boundaries of a set of polygons that you define. Any waveform or sample that falls within the boundaries of one or more polygons is recorded as a failure.

Reporting the Setup

Use :MTEST? to query setup information for the MTEST subsystem.

Return Format

The following is a sample response from the :MTEST? query. In this case, the query was issued following a *RST command.

:MTEST:ALL

N (see [page 798](#))

Command Syntax `:MTEST:ALL <on_off>`

`<on_off> ::= {{1 | ON} | {0 | OFF}}`

The :MTEST:ALL command specifies the channel(s) that are included in the mask test:

- ON – All displayed analog channels are included in the mask test.
- OFF – Just the selected source channel is included in the test.

Query Syntax `:MTEST:ENABLE?`

The :MTEST:ENABLE? query returns the current setting.

Return Format `<on_off><NL>`

`<on_off> ::= {1 | 0}`

See Also • "Introduction to :MTEST Commands" on page 387

:MTEST:AMASK:CREate

N (see [page 798](#))

Command Syntax

`:MTEST :AMASK :CREate`

The :MTEST:AMASK:CREate command automatically constructs a mask around the current selected channel, using the tolerance parameters defined by the :MTEST:AMASK:XDELta, :MTEST:AMASK:YDELta, and :MTEST:AMASK:UNITS commands. The mask only encompasses the portion of the waveform visible on the display, so you must ensure that the waveform is acquired and displayed consistently to obtain repeatable results.

The :MTEST:SOURce command selects the channel and should be set before using this command.

Example Code

:MTEST:AMASK:SOURce

N (see [page 798](#))

Command Syntax `:MTEST:AMASK:SOURce <source>`

```
<source> ::= CHANnel<n>
<n> ::= 1 to (# analog channels) in NR1 format
```

The :MTEST:AMASK:SOURce command selects the source for the interpretation of the :MTEST:AMASK:XDELta and :MTEST:AMASK:YDELta parameters when :MTEST:AMASK:UNITS is set to CURRent.

When UNITS are CURRent, the XDELta and YDELta parameters are defined in terms of the channel units, as set by the :CHANnel<n>:UNITS command, of the selected source.

Suppose that UNITS are CURRent and that you set SOURce to CHANNEL1, which is using units of volts. Then you can define AMASK:XDELta in terms of volts and AMASK:YDELta in terms of seconds.

This command is the same as the :MTEST:SOURce command.

Query Syntax `:MTEST:AMASK:SOURce?`

The :MTEST:AMASK:SOURce? query returns the currently set source.

Return Format

```
<source> ::= CHAN<n>
<n> ::= 1 to (# analog channels) in NR1 format
```

:MTEST:AMASK:UNITS

N (see [page 798](#))

Command Syntax	<code>:MTEST:AMASK:UNITS <units></code> <code><units> ::= {CURREnt DIVisions}</code>
	The :MTEST:AMASK:UNITS command alters the way the mask test subsystem interprets the tolerance parameters for automasking as defined by :MTEST:AMASK:XDELta and :MTEST:AMASK:YDELta commands.
	<ul style="list-style-type: none"> • CURREnt – the mask test subsystem uses the units as set by the :CHANnel<n>:UNITS command, usually time for ΔX and voltage for ΔY. • DIVisions – the mask test subsystem uses the graticule as the measurement system, so tolerance settings are specified as parts of a screen division. The mask test subsystem maintains separate XDELta and YDELta settings for CURREnt and DIVisions. Thus, XDELta and YDELta are not converted to new values when the UNITS setting is changed.
Query Syntax	<code>:MTEST:AMASK:UNITS?</code>
	The :MTEST:AMASK:UNITS query returns the current measurement units setting for the mask test automask feature.
Return Format	<code><units><NL></code> <code><units> ::= {CURREnt DIVisions}</code>

:MTEST:AMASK:XDELta

N (see [page 798](#))

Command Syntax

```
:MTEST:AMASK:XDELta <value>
<value> ::= X delta value in NR3 format
```

The :MTEST:AMASK:XDELta command sets the tolerance in the X direction around the waveform for the automasking feature. The absolute value of the tolerance will be added and subtracted to horizontal values of the waveform to determine the boundaries of the mask.

The horizontal tolerance value is interpreted based on the setting specified by the :MTEST:AMASK:UNITs command; thus, if you specify 250-E3, the setting for :MTEST:AMASK:UNITs is CURRent, and the current setting specifies time in the horizontal direction, the tolerance will be ± 250 ms. If the setting for :MTEST:AMASK:UNITs is DIVisions, the same X delta value will set the tolerance to ± 250 millidivisions, or 1/4 of a division.

Query Syntax

```
:MTEST:AMASK:XDELta?
```

The :MTEST:AMASK:XDELta? query returns the current setting of the ΔX tolerance for automasking. If your computer program will interpret this value, it should also request the current measurement system using the :MTEST:AMASK:UNITs query.

Return Format

```
<value><NL>
<value> ::= X delta value in NR3 format
```

:MTEST:AMASK:YDELta

N (see [page 798](#))

Command Syntax	<code>:MTEST:AMASK:YDELta <value></code> <code><value> ::= Y delta value in NR3 format</code>
	The :MTEST:AMASK:YDELta command sets the vertical tolerance around the waveform for the automasking feature. The absolute value of the tolerance will be added and subtracted to vertical values of the waveform to determine the boundaries of the mask.
	The vertical tolerance value is interpreted based on the setting specified by the :MTEST:AMASK:UNITs command; thus, if you specify 250-E3, the setting for :MTEST:AMASK:UNITs is CURRent, and the current setting specifies voltage in the vertical direction, the tolerance will be ± 250 mV. If the setting for :MTEST:AMASK:UNITs is DIVisions, the same Y delta value will set the tolerance to ± 250 millidivisions, or 1/4 of a division.
Query Syntax	<code>:MTEST:AMASK:YDELta?</code>
	The :MTEST:AMASK:YDELta? query returns the current setting of the ΔY tolerance for automasking. If your computer program will interpret this value, it should also request the current measurement system using the :MTEST:AMASK:UNITs query.
Return Format	<code><value><NL></code> <code><value> ::= Y delta value in NR3 format</code>

If the Bind -1 & 0 Levels control is enabled, the -1 Level and the 0 Level controls track each other. Adjusting either the -1 Level or the 0 Level control shifts the position of the mask up or down without changing its size.

- OFF –

If the Bind 1 & 0 Levels control is disabled, adjusting either the 1 Level or the 0 Level control changes the vertical height of the mask.

:MTEST:SCALe:X1

N (see [page 798](#))

Command Syntax

```
:MTEST:SCALe:X1 <x1_value>
<x1_value> ::= X1 value in NR3 format
```

The :MTEST:SCALe:X1 command defines where X=0 in the base coordinate system used for mask testing. The other X-coordinate is defined by the :MTEST:SCALe:XDELta command. Once the X1 and XDELta coordinates are set, all X values of vertices in the mask regions are defined with respect to this value, according to the equation:

$$x = (x * \Delta x) + x_1$$

Thus, if you set X1 to 100 ms, and XDELta to 100 ms, an X value of 0.100 is a vertex at 110 ms.

The oscilloscope uses this equation to normalize vertices. This simplifies reprogramming to handle different data rates. For example, if you halve the period of the waveform of interest, you need only to adjust the XDELta value to set up the mask for the new waveform.

The X1 value is a time value specifying the location of the X1 coordinate, which will then be treated as X=0 for mask regions coordinates.

Query Syntax

```
:MTEST:SCALe:X1?
```

The :MTEST:SCALe:X1? query returns the current X1 coordinate setting.

Return Format

```
<x1_value><NL>
<x1_value> ::= X1 value in NR3 format
```

:MTEST:SCALe:XDELta

N (see [page 798](#))

Command Syntax `:MTEST:SCALe:XDELta <xdelta_value>`

`<xdelta_value> ::= X delta value in NR3 format`

The :MTEST:SCALe:XDELta command defines the position of the X2 marker with respect to the X1 marker. In the mask test coordinate system, the X1 marker defines where X=0; thus, the X2 marker defines where X=1.

Because all X vertices of the regions defined for mask testing are normalized with respect to X1 and ΔX , redefining ΔX also moves those vertices to stay in the same locations with respect to X1 and ΔX . Thus, in many applications, it is best if you define XDELta as a pulse width or bit period. Then, a change in data rate without corresponding changes in the waveform can easily be handled by changing ΔX .

The X-coordinate of polygon vertices is normalized using this equation:

$$X = (X * \Delta X) + X_1$$

The X delta value is a time value specifying the distance of the X2 marker with respect to the X1 marker.

For example, if the period of the waveform you wish to test is 1 ms, setting ΔX to 1 ms ensures that the waveform's period is between the X1 and X2 markers.

Query Syntax `:MTEST:SCALe:XDELta?`

The :MTEST:SCALe:XDELta? query returns the current value of ΔX .

Return Format `<xdelta_value><NL>`

`<xdelta_value> ::= X delta value in NR3 format`

N (see [page 798](#))

Command Syntax :MTEST:SCALe:Y1 <y1_value>

<y1_value> ::= Y1 value in NR3 format

The :MTEST:SCALe:Y1 command defines where Y=0 in the coordinate system for mask testing. All Y values of vertices in the coordinate system are defined with respect to the boundaries set by SCALe:Y1 and SCALe:Y2 according to the equation:

$$Y = (Y * (Y2 - Y1)) + Y1$$

Thus, if you set Y1 to 100 mV, and Y2 to 1 V, a Y value of 0.100 in a vertex is at 190 mV.

The Y1 value is a voltage value specifying the point at which Y=0.

Query Syntax :MTEST:SCALe:Y1?

The :MTEST:SCALe:Y2 command defines the Y2 marker in the coordinate system for mask testing. All Y values of vertices in the coordinate system are defined with respect to the boundaries defined by SCALe:Y1 and SCALe:Y2 according to the following equation:

$$Y = (Y * (Y2 - Y1)) + Y1$$

Thus, if you set Y1 to 100 mV, and Y2 to 1 V, a Y value of 0.100 in a vertex is at 190 mV.

Reporting the Setup

Use :SAVE? to query setup information for the SAVE subsystem.

Return Format

The following is a sample response from the :SAVE? query. In this case, the query was issued following the *RST command.

```
:SAVE:FIL ""; :SAVE:IMAG:AREA GRAT;FACT 0;FORM TIFF;INKS 0;PAL  
MON; :SAVE:PWD "C:/setups/"; :SAVE:WAV:FORM NONE;LENG 1000;SEGM CURR
```

25 :SBUS<n> Commands

Control the modes and parameters for each serial bus decode/trigger type. See:

- "[Introduction to :SBUS<n> Commands](#)" on page 455
- "[General :SBUS<n> Commands](#)" on page 457
- "[:SBUS<n>:CAN Commands](#)" on page 460

- "[:SBUS<n>:UART Commands](#)" on page 517

**Introduction to
:SBUS<n>
Commands**

The :SBUS subsystem commands control the serial decode bus viewing, mode, and other options.

NOTE

These commands are only valid on oscilloscope models when a serial decode option has been licensed.

The following serial bus decode/trigger types are available (see "[:TRIGger:MODE](#)" on page 606).

- **CAN (Controller Area Network) triggering**— will trigger on CAN version 2.0A and 2.0B signals. Setup consists of connecting the oscilloscope to a CAN signal. Baud rate, signal source, and signal polarity, and type of data to trigger on can be specified. You can trigger on CAN data and identifier patterns and you can set the bit sample point.
- **IIC (Inter-IC bus) triggering**— consists of connecting the oscilloscope to the serial data (SDA) line and the serial clock (SCL) line, then triggering on a stop/start condition, a restart, a missing acknowledge, or on a read/write frame with a specific device address and data value.
- **LIN (Local Interconnect Network) triggering**— will trigger on LIN sync break at the beginning of a message frame. You can trigger on Sync Break, Frame IDs, or Frame IDs and Data.

- **SPI (Serial Peripheral Interface) triggering**— consists of connecting the oscilloscope to a clock, data (MOSI or MISO), and framing signal. You can then trigger on a data pattern during a specific framing period. The serial data string can be specified to be from 4 to 64 bits long.
- **UART/RS-232 triggering** (with Option 232) – lets you trigger on RS-232 serial data.

NOTE

Two I2S buses or two SPI buses cannot be decoded on both SBUS1 and SBUS2 at the same time.

Reporting the Setup

Use :SBUS<n>? to query setup information for the :SBUS<n> subsystem.

Return Format

The following is a sample response from the :SBUS1? query. In this case, the query was issued following a *RST command.

```
:SBUS1:DISP 0;MODE IIC;:SBUS1:IIC:ASIZ BIT7;:SBUS1:IIC:TRIG:TYPE  
STAR;QUAL EQU;:SBUS1:IIC:SOUR:CLOC CHAN1;DATA

:SBUS<n>:CAN:TRIGger:PATTern:DATA

N (see [page 798](#))

Command Syntax

```
:SBUS<n>:CAN:TRIGger:PATTern:DATA <string>
<string> ::= "nn...n" where n ::= {0 | 1 | X | $}
<string> ::= "0xnn...n" where n ::= {0,...,9 | A,...,F | X | $}
```

The :SBUS<n>:CAN:TRIGger:PATTern:DATA command defines the CAN data pattern resource according to the string parameter. This pattern, along with the data length (set by the :SBUS<n>:CAN:TRIGger:PATTern:DATA:LENGth command), control the data pattern searched for in each CAN message.

If the string parameter starts with "0x", it is a hexadecimal string made up of hexadecimal and X (don't care) characters; otherwise, it is a binary string made up of 0, 1, and X (don't care) characters.

NOTE

If more bits are sent for <string> than specified by the :SBUS<n>:CAN:TRIGger:PATTern:DATA:LENGth command, the most significant bits will be truncated. If the data length is changed after the <string> is programmed, the added or deleted bits will be added to or deleted from the least significant bits.

Query Syntax

```
:SBUS<n>:CAN:TRIGger:PATTern:DATA?
```

The :SBUS<n>:CAN:TRIGger:PATTern:DATA? query returns the current settings of the specified CAN data pattern resource in the binary string format.

Query Syntax	<code>:SBUS<n>:CAN:TRIGger:PATTern:DATA:LENGth?</code>
	The :SBUS<n>:CAN:TRIGger:PATTern:DATA:LENGth? query returns the current CAN data pattern length setting.

<string> ::= "nn...n" where n ::= {0 | 1 | X | $}
<string> ::= "0xnn...n" where n ::= {0,...,9 | A,...,F | X | $}
```

The :SBUS<n>:CAN:TRIGger:PATTern:ID command defines the CAN identifier pattern resource according to the string parameter. This pattern, along with the identifier mode (set by the :SBUS<n>:CAN:TRIGger:PATTern:ID:MODE command), control the identifier pattern searched for in each CAN message.

If the string parameter starts with "0x", it is a hexadecimal string made up of hexadecimal and X (don't care) characters; otherwise, it is a binary string made up of 0, 1, and X (don't care) characters.

NOTE

The ID pattern resource string is always 29 bits. Only 11 of these bits are used when the :SBUS<n>:CAN:TRIGger:PATTern:ID:MODE is STANDard.

A string longer than 29 bits is truncated to 29 bits when setting the ID pattern resource.

:SBUS<n>:LIN:TRIGger:PATTERn:DATA

N (see [page 798](#))

Command Syntax

```
:SBUS<n>:LIN:TRIGger:PATTERn:DATA <string>
<string> ::= "n" where n ::= 32-bit integer in unsigned decimal when
             <base> = DECimal
<string> ::= "nn...n" where n ::= {0 | 1 | X | $} when
             <base> = BINary
<string> ::= "0xnn...n" where n ::= {0,...,9 | A,...,F | X | $} when
             <base> = HEX
```

NOTE

<base> is specified with the :SBUS<n>:LIN:TRIGger:PATTERn:FORMat command. The default <base> is BINary.

The :SBUS<n>:LIN:TRIGger:PATTERn:DATA command specifies the LIN trigger data pattern searched for in each LIN data field.

Set a <string> bit to "0" or "1" to set the corresponding bit in the data pattern to low or high, respectively.

Set a <string> bit to "X" to ignore (mask off) that bit in the data pattern.

Use the "\$" character to indicate that the value of the corresponding bit will not be changed (the existing bit value is used).

When <base> = DECimal, the "X" and "\$" characters cannot be entered. When queried, the "\$" character is returned when any bits in the pattern have the value of "X" and <base> = DECimal. When any bits in a given nibble have the value of "X" and <base> = HEX, the "\$" character is returned for the corresponding nibble.

NOTE

The length of the trigger data value is determined by the :SBUS<n>:LIN:TRIGger:PATTERn:DATA:LENGTH command.

NOTE

If more bits are sent for <string> than the specified trigger pattern data length, the most significant bits will be truncated. If the data length size is changed after the <string> is programmed, the added or deleted bits will be added to or deleted from the least significant bits.

Query Syntax

```
:SBUS<n>:LIN:TRIGger:PATTERn:DATA?
```

The :SBUS<n>:LIN:TRIGger:PATTERn:DATA? query returns the currently specified LIN trigger data pattern.

Return Format

```
<string><NL>
```

Introduction to :SYSTem Commands SYSTem subsystem commands enable writing messages to the display, setting and reading both the time and the date, querying for errors, and saving and recalling setups.

:SYSTem:DATE

N (see page 798)

The :SYSTem:DATE command sets the date. Validity checking is performed to ensure that the date is valid.

Query Syntax :SYSTEm:DATE?

The SYSTem:DATE? query returns the date.

Return Format <year>, <month>, <day><NL>

:SYSTem:DSP

N (see [page 798](#))

Command Syntax `:SYSTem:DSP <string>`

`<string>` ::= quoted ASCII string (up to 75 characters)

The :SYSTem:DSP command writes the quoted string (excluding quotation marks) to a text box in the center of the display. Use :SYSTem:DSP "" to remotely remove the message from the display. (Two sets of quote marks without a space between them creates a NULL string.) Press any menu key to manually remove the message from the display.

:SYSTem:ERRor

C (see [page 798](#))

Query Syntax :SYSTem:ERRor?

The :SYSTem:ERRor? query outputs the next error number and text from the error queue. The instrument has an error queue that is 30 errors deep and operates on a first-in, first-out basis. Repeatedly sending the :SYSTem:ERRor? query returns the errors in the order that they occurred until the queue is empty. Any further queries then return zero until another error occurs.

Return Format	<pre><error number>,<error string><NL> <error number> ::= an integer error code in NR1 format <error string> ::= quoted ASCII string containing the error message</pre> <p>Error messages are listed in Chapter 34, “Error Messages,” starting on page 759.</p>

N (see [page 798](#))

Command Syntax `:SYSTem:LOCK <value>`

`<value> ::= {{1 | ON} | {0 | OFF}}`

The :SYSTem:LOCK command disables the front panel. LOCK ON is the equivalent of sending a local lockout message over the programming interface.

Query Syntax `:SYSTem:LOCK?`

The :SYSTem:LOCK? query returns the lock status of the front panel.

Return Format `<value><NL>`

`<value> ::= {1 | 0}`

`<menu> ::= {MASK | MEASure | SEGmented | LISTer}`

The :SYSTem:MENU command changes the front panel softkey menu.

:SYSTem:PRESet

C (see [page 798](#))

Command Syntax :SYSTem:PRESet

The :SYSTem:PRESet command places the instrument in a known state. This is the same as pressing the **[Default Setup]** key or **[Save/Recall] > Default/Erase > Default Setup** on the front panel.

When you perform a default setup, some user settings (like preferences) remain unchanged. To reset all user settings to their factory defaults, use the *RST command.

Introduction to :T1Mebase Commands The T1Mebase subsystem commands control the horizontal (X-axis) functions and set the oscilloscope to X-Y mode (where channel 1 becomes the X input and channel 2 becomes the Y input). The time per division, delay, vernier control, and reference can be controlled for the main and window (zoomed) time bases.

Reporting the Setup

Use :T1Mebase? to query setup information for the T1Mebase subsystem.

Return Format

The following is a sample response from the :T1Mebase? query. In this case, the query was issued following a *RST command.

```
:T1M:MODE MAIN;REF CENT;MAIN:RANG +1.00E-03;POS +0.0E+00
```

:TIMEbase:MODE

C (see [page 798](#))

Command Syntax :TIMEbase:MODE <value>

<value> ::= {MAIN | WINDOW | XY | ROLL}

The :TIMEbase:MODE command sets the current time base. There are four time base modes:

- MAIN – The normal time base mode is the main time base. It is the default time base mode after the *RST (Reset) command.
- WINDOW – In the WINDOW (zoomed or delayed) time base mode, measurements are made in the zoomed time base if possible; otherwise, the measurements are made in the main time base.
- XY – In the XY mode, the :TIMEbase:RANGE, :TIMEbase:POSITION, and :TIMEbase:REFERENCE commands are not available. No measurements are available in this mode.
- ROLL – In the ROLL mode, data moves continuously across the display from left to right. The oscilloscope runs continuously and is untriggered. The :TIMEbase:REFERENCE selection changes to RIGHT.

Query Syntax :TIMEbase:MODE?

The :TIMEbase:MODE query returns the current time base mode.

Return Format <value><NL>

<value> ::= {MAIN | WIND | XY | ROLL}

29 :TRIGger Commands

Control the trigger modes and parameters for each trigger type. See:

Introduction to :TRIGger Commands

The commands in the TRIGger subsystem define the conditions for an internal trigger. Many of these commands are valid in multiple trigger modes.

The default trigger mode is :EDGE.

The trigger subsystem controls the trigger sweep mode and the trigger specification. The trigger sweep (see [":TRIGger:SWEep" on page 608](#)) can be AUTO or NORMal.

- **NORMal** mode – displays a waveform only if a trigger signal is present and the trigger conditions are met. Otherwise the oscilloscope does not trigger and the display is not updated. This mode is useful for low-repetitive-rate signals.
- **AUTO** trigger mode – generates an artificial trigger event if the trigger specification is not satisfied within a preset time, acquires unsynchronized data and displays it.

AUTO mode is useful for signals other than low-repetitive-rate signals. You must use this mode to display a DC signal because there are no edges on which to trigger.

The following trigger types are available (see [":TRIGger:MODE" on page 606](#)).

- **Edge triggering**— identifies a trigger by looking for a specified slope and voltage level on a waveform.
- **Pulse width triggering**— (:TRIGger:GLITch commands) sets the oscilloscope to trigger on a positive pulse or on a negative pulse of a specified width.
- **Pattern triggering**— identifies a trigger condition by looking for a specified pattern. This pattern is a logical AND combination of the channels. You can also trigger on a specified time duration of a pattern.

- **TV triggering**— is used to capture the complicated waveforms of television equipment. The trigger circuitry detects the vertical and horizontal interval of the waveform and produces triggers based on the TV trigger settings you selected. TV triggering requires greater than $\frac{1}{4}$ division of sync amplitude with any analog channel as the trigger source.

Reporting the Setup

Use :TRIGger? to query setup information for the TRIGger subsystem.

Return Format

The return format for the TRIGger? query varies depending on the current mode. The following is a sample response from the :TRIGger? query. In this case, the query was issued following a *RST command.

```
:TRIG:MODE EDGE;SWE AUTO;NREJ 0;HFR 0;HOLD +60.000000000000E-09;  
:TRIG:EDGE:SOUR CHAN1;LEV +0.00000E+00;SLOP POS;REJ OFF;COUP DC

:TRIGger:FORCe

N (see [page 798](#))

Command Syntax :TRIGger:FORCe

The :TRIGger:FORCe command causes an acquisition to be captured even though the trigger condition has not been met. This command is equivalent to the front panel **[Force Trigger]** key.

See Also • ["Introduction to :TRIGger Commands"](#) on page 597

:TRIGger:HFReject

 (see [page 798](#))

Command Syntax `:TRIGger:HFReject <value>`

`<value> ::= {{0 | OFF} | {1 | ON}}`

The :TRIGger:HFReject command turns the high frequency reject filter off and on. The high frequency reject filter adds a 50 kHz low-pass filter in the trigger path to remove high frequency components from the trigger waveform. Use this filter to remove high-frequency noise, such as AM or FM broadcast stations, from the trigger path.

Query Syntax `:TRIGger:HFReject?`

The :TRIGger:HFReject? query returns the current high frequency reject filter mode.

Return Format `<value><NL>`

`<value> ::= {0 | 1}`

:TRIGger:HOLDoff

 (see [page 798](#))

Command Syntax `:TRIGger:HOLDoff <holdoff_time>`

`<holdoff_time> ::= 60 ns to 10 s in NR3 format`

The :TRIGger:HOLDoff command defines the holdoff time value in seconds. Holdoff keeps a trigger from occurring until after a certain amount of time has passed since the last trigger. This feature is valuable when a waveform crosses the trigger level multiple times during one period of the waveform. Without holdoff, the oscilloscope could trigger on each of the crossings, producing a confusing waveform. With holdoff set correctly, the oscilloscope always triggers on the same crossing. The correct holdoff setting is typically slightly less than one period.

Query Syntax `:TRIGger:HOLDoff?`

The :TRIGger:HOLDoff? query returns the holdoff time value for the current trigger mode.

Return Format `<holdoff_time><NL>`

`<holdoff_time> ::= the holdoff time value in seconds in NR3 format.`

See Also • "Introduction to :TRIGger Commands" on page 597

:TRIGger:LEVel:ASETUp

N (see [page 798](#))

Command Syntax :TRIGger:LEVel:ASETUp

The :TRIGger:LEVel:ASETUp command automatically sets the trigger levels of all displayed analog channels to their waveforms' 50% values.

If AC coupling is used, the trigger levels are set to 0 V.

When High and Low (dual) trigger levels are used (as with Rise/Fall Time and Runt triggers, for example), this command has no effect.

The :TRIGger:MODE command selects the trigger mode (trigger type).

Query Syntax `:TRIGger:MODE?`

The :TRIGger:MODE? query returns the current trigger mode. If the :TIMEbase:MODE is ROLL or XY, the query returns "NONE".

Return Format `<mode><NL>`

`<mode> ::= {EDGE | GLIT | PATT | TV}`

- See Also**
- "[Introduction to :TRIGger Commands](#)" on page 597

:TRIGger:NREject

C (see [page 798](#))

Command Syntax `:TRIGger:NREject <value>`

`<value> ::= {{0 | OFF} | {1 | ON}}`

The :TRIGger:NREject command turns the noise reject filter off and on. When the noise reject filter is on, the trigger circuitry is less sensitive to noise but may require a greater amplitude waveform to trigger the oscilloscope. This command is not valid in TV trigger mode.

Query Syntax `:TRIGger:NREject?`

The :TRIGger:NREject? query returns the current noise reject filter mode.

Return Format `<value><NL>`

`<value> ::= {0 | 1}`

See Also • ["Introduction to :TRIGger Commands" on page 597](#)

:TRIGger:SWEep

C (see [page 798](#))

Command Syntax `:TRIGger:SWEep <sweep>`

`<sweep> ::= {AUTO | NORMAl}`

The :TRIGger:SWEep command selects the trigger sweep mode.

When AUTO sweep mode is selected, a baseline is displayed in the absence of a signal. If a signal is present but the oscilloscope is not triggered, the unsynchronized signal is displayed instead of a baseline.

When NORMAl sweep mode is selected and no trigger is present, the instrument does not sweep, and the data acquired on the previous trigger remains on the screen.

NOTE

This feature is called "Mode" on the instrument's front panel.

Query Syntax `:TRIGger:SWEep?`

The :TRIGger:SWEep? query returns the current trigger sweep mode.

Return Format `<sweep><NL>`

`<sweep> ::= current trigger sweep mode`

:TRIGger[:EDGE]:COUPLing

C (see [page 798](#))

Command Syntax

```
:TRIGger[:EDGE]:COUPLing <coupling>
<coupling> ::= {AC | DC | LFReject}
```

The :TRIGger[:EDGE]:COUPLing command sets the input coupling for the selected trigger sources. The coupling can be set to AC, DC, or LFReject.

- AC coupling places a high-pass filter (10 Hz for analog channels, and 3.5 Hz for all External trigger inputs) in the trigger path, removing dc offset voltage from the trigger waveform. Use AC coupling to get a stable edge trigger when your waveform has a large dc offset.
- LFReject coupling places a 50 KHz high-pass filter in the trigger path.
- DC coupling allows dc and ac signals into the trigger path.

NOTE

The :TRIGger[:EDGE]:COUPLing and the :TRIGger[:EDGE]:REJect selections are coupled. Changing the setting of the :TRIGger[:EDGE]:REJect can change the COUPLing setting.

Query Syntax

```
:TRIGger[:EDGE]:COUPLing?
```

The :TRIGger[:EDGE]:COUPLing? query returns the current coupling selection.

Return Format

```
<coupling><NL>
<coupling> ::= {AC | DC | LFR}

- The low frequency reject filter adds a 50 kHz high-pass filter in series with the trigger waveform to remove any unwanted low frequency components from a trigger waveform, such as power line frequencies, that can interfere with proper triggering.

NOTE

The :TRIGger[:EDGE]:REJect and the :TRIGger[:EDGE]:COUPLing selections are coupled. Changing the setting of the :TRIGger[:EDGE]:COUPLing can change the COUPLing setting.

:TRIGger:PATTERn

C (see [page 798](#))

Command Syntax

```
:TRIGger:PATTERn <pattern>
<pattern> ::= <string>[,<edge_source>,<edge>]
<string> ::= "nn...n" where n ::= {0 | 1 | X | R | F} when
            <base> = ASCII
<string> ::= "0xnn...n" where n ::= {0,...,9 | A,...,F | X | $} when
            <base> = HEX
<edge_source> ::= {CHANnel<n> | NONE} for DSO models
<edge_source> ::= {CHANnel<n> | DIGital<d>
            | NONE} for MSO models
<n> ::= 1 to (# of analog channels) in NR1 format
<d> ::= 0 to (# digital channels - 1) in NR1 format
<edge> ::= {POSitive | NEGative}
```

The :TRIGger:PATTERn command specifies the channel values to be used in the pattern trigger.

In the <string> parameter, each bit corresponds to a channel as described in the following table:

Oscilloscope Models	Value and Mask Bit Assignments
4 analog + 8 digital channels (mixed-signal)	Bits 0 through 7 - digital channels 0 through 7. Bits 8 through 11 - analog channels 4 through 1.
2 analog + 8 digital channels (mixed-signal)	Bits 0 through 7 - digital channels 0 through 7. Bits 8 and 9 - analog channels 2 and 1.
4 analog channels only	Bits 0 through 3 - analog channels 4 through 1.
2 analog channels only	Bits 0 and 1 - analog channels 2 and 1.

The format of the <string> parameter depends on the :TRIGger:PATTERn:FORMAT command setting:

- When the format is ASCII, the string looks just like the string you see on the oscilloscope's front panel, made up of 0, 1, X (don't care), R (rising edge), and F (falling edge) characters.
- When the format is HEX, the string begins with "0x" and contains hex digit characters or X (don't care for all four bits in the nibble).

With the hex format string, you can use the <edge_source> and <edge> parameters to specify an edge on one of the channels.

NOTE

The optional <edge_source> and <edge> parameters should be sent together or not at all. The edge can be specified in the ASCII <string> parameter. If the edge source and edge parameters are used, they take precedence.

You can only specify an edge on one channel. When an edge is specified, the :TRIGger:PATTERn:QUALifier does not apply.

Query Syntax :TRIGger:PATTERn?

The :TRIGger:PATTERn? query returns the pattern string, edge source, and edge.

**Introduction to :WAVEform Commands** The WAVEform subsystem is used to transfer data to a controller from the oscilloscope waveform memories. The queries in this subsystem will only operate when the channel selected by :WAVEform:SOURce is on.

### Waveform Data and Preamble

The waveform record is actually contained in two portions: the preamble and waveform data. The waveform record must be read from the oscilloscope by the controller using two separate commands, :WAVEform:DATA (see [page 645](#)) and :WAVEform:PREamble (see [page 652](#)). The waveform data is the actual data acquired for each point in the specified source. The preamble contains the information for interpreting the waveform data, which includes the number of points acquired, the format of acquired data, and the type of acquired data. The preamble also contains the X and Y increments, origins, and references for the acquired data, so that word and byte data can be translated to time and voltage values.

### Data Acquisition Types

There are four types of waveform acquisitions that can be selected for analog channels with the :ACQuire:TYPE command (see [page 195](#)): NORMal, AVERage, PEAK, and HRESolution. Digital channels are always acquired using NORMal. When the data is acquired using the :DIGItize command (see [page 159](#)) or :RUN command (see [page 176](#)), the data is placed in the channel buffer of the specified source.

Once you have acquired data with the :DIGItize command, the instrument is stopped. If the instrument is restarted (via the programming interface or the front panel), or if any instrument setting is changed, the data acquired with the :DIGItize command may be overwritten. You should first acquire the data with the :DIGItize command, then immediately read the data with the :WAVEform:DATA? query (see [page 645](#)) before changing any instrument setup.

A waveform record consists of either all of the acquired points or a subset of the acquired points. The number of points acquired may be queried using :ACQuire:POINts? (see [page 188](#)).

#### **Helpful Hints:**

The number of points transferred to the computer is controlled using the :WAVEform:POINts command (see [page 648](#)). If :WAVEform:POINts MAXimum is specified and the instrument is not running (stopped), all of the points that are displayed are transferred. This can be as many as 4,000,000 in some operating modes or as many as 8,000,000 for a digital channel on the mixed signal oscilloscope. Fewer points may be specified to speed data transfers and minimize controller analysis time. The :WAVEform:POINts may be varied even after data on a channel is acquired. However, this decimation may result in lost pulses and transitions. The number of points selected for transfer using :WAVEform:POINts must be an even divisor of 1,000 or be set to MAXimum. :WAVEform:POINts determines the increment between time buckets that will be transferred. If POINts = MAXimum, the data cannot be decimated. For example:

- `:WAVEform:POINts 1000` – returns time buckets 0, 1, 2, 3, 4, ..., 999.
- `:WAVEform:POINts 500` – returns time buckets 0, 2, 4, 6, 8, ..., 998.
- `:WAVEform:POINts 250` – returns time buckets 0, 4, 8, 12, 16, ..., 996.
- `:WAVEform:POINts 100` – returns time buckets 0, 10, 20, 30, 40, ..., 990.

#### **Analog Channel Data**

##### **NORMal Data**

Normal data consists of the last data point (hit) in each time bucket. This data is transmitted over the programming interface in a linear fashion starting with time bucket 0 and going through time bucket  $n - 1$ , where  $n$  is the number returned by the :WAVEform:POINts? query (see [page 648](#)). Only the magnitude values of each data point are transmitted. The first voltage value corresponds to the first time bucket on the left side of the screen and the last value corresponds to the

next-to-last time bucket on the right side of the screen. Time buckets without data return 0. The time values for each data point correspond to the position of the data point in the data array. These time values are not transmitted.

### **AVERage Data**

AVERage data consists of the average of the first n hits in a time bucket, where n is the value returned by the :ACQuire:COUNt query (see [page 186](#)). Time buckets that have fewer than n hits return the average of the data they do have. If a time bucket does not have any data in it, it returns 0.

This data is transmitted over the interface linearly, starting with time bucket 0 and proceeding through time bucket n-1, where n is the number returned by the :WAVeform:POINts? query (see [page 648](#)). The first value corresponds to a point at the left side of the screen and the last value corresponds to one point away from the right side of the screen. The maximum number of points that can be returned in average mode is 1000 unless ACQuire:COUNt has been set to 1.

### **PEAK Data**

Peak detect display mode is used to detect glitches for time base settings of 500 us/div and slower. In this mode, the oscilloscope can sample more data than it can store and display. So, when peak detect is turned on, the oscilloscope scans through the extra data, picks up the minimum and maximum for each time bucket, then stores the data in an array. Each time bucket contains two data sample.

The array is transmitted over the interface bus linearly, starting with time bucket 0 proceeding through time bucket n-1, where n is the number returned by the :WAVeform:POINts? query (see [page 648](#)). In each time bucket, two values are transmitted, first the minimum, followed by the maximum. The first pair of values corresponds to the time bucket at the leftmost side of the screen. The last pair of values corresponds to the time bucket at the far right side of the screen. In :ACQuire:TYPE PEAK mode (see [page 195](#)), the value returned by the :WAVeform:XINCrement query (see [page 665](#)) should be doubled to find the time difference between the min-max pairs.

### **HRESolution Data**

The high resolution (*smoothing*) mode is used to reduce noise at slower sweep speeds where the digitizer samples faster than needed to fill memory for the displayed time range.

### **Data Conversion**

Word or byte data sent from the oscilloscope must be scaled for useful interpretation. The values used to interpret the data are the X and Y references, X and Y origins, and X and Y increments. These values are read from the waveform preamble. Each channel has its own waveform preamble.

In converting a data value to a voltage value, the following formula is used:

$$\text{voltage} = [(\text{data value} - \text{yreference}) * \text{yincrement}] + \text{yorigin}$$

If the :WAVeform:FORMat data format is ASCii (see [page 647](#)), the data values are converted internally and sent as floating point values separated by commas.

In converting a data value to time, the time value of a data point can be determined by the position of the data point. For example, the fourth data point sent with :WAVeform:XORigin = 16 ns, :WAVeform:XREFerence = 0, and :WAVeform:XINCrement = 2 ns, can be calculated using the following formula:

$$\text{time} = [(\text{data point number} - \text{xreference}) * \text{xincrement}] + \text{xorigin}$$

This would result in the following calculation for time bucket 3:

$$\text{time} = [(3 - 0) * 2 \text{ ns}] + 16 \text{ ns} = 22 \text{ ns}$$

In :ACQuire:TYPE PEAK mode (see [page 195](#)), because data is acquired in max-min pairs, modify the previous time formula to the following:

$$\text{time} = [(\text{data pair number} - \text{xreference}) * \text{xincrement} * 2] + \text{xorigin}$$

### **Data Format for Transfer**

There are three formats for transferring waveform data over the interface: BYTE, WORD and ASCii (see "[:WAVeform:FORMat](#)" on page 647). BYTE, WORD and ASCii formatted waveform records are transmitted using the arbitrary block program data format specified in IEEE 488.2.

When you use the block data format, the ASCII character string "#8<DD...D>" is sent prior to sending the actual data. The 8 indicates how many Ds follow. The Ds are ASCII numbers that indicate how many data bytes follow.

For example, if 1000 points will be transferred, and the WORD format was specified, the block header "#800001000" would be sent. The 8 indicates that eight length bytes follow, and 00001000 indicates that 1000 binary data bytes follow.

Use the :WAVeform:UNSIGNED command (see [page 663](#)) to control whether data values are sent as unsigned or signed integers. This command can be used to match the instrument's internal data type to the data type used by the programming language. This command has no effect if the data format is ASCii.

#### **Data Format for Transfer - ASCii format**

The ASCii format (see "[:WAVeform:FORMat](#)" on page 647) provides access to the waveform data as real Y-axis values without using Y origin, Y reference, and Y increment to convert the binary data. Values are transferred as ASCii digits in floating point format separated by commas. In ASCii format, holes are represented by the value 9.9e+37. The setting of :WAVeform:BYTeorder (see [page 643](#)) and :WAVeform:UNSIGNED (see [page 663](#)) have no effect when the format is ASCii.

#### **Data Format for Transfer - WORD format**

WORD format (see "[:WAVeform:FORMat](#)" on page 647) provides 16-bit access to the waveform data. In the WORD format, the number of data bytes is twice the number of data points. The number of data points is the value returned by the :WAVeform:POINts? query (see [page 648](#)). If the data intrinsically has less than 16 bits of resolution, the data is left-shifted to provide 16 bits of resolution and the least significant bits are set to 0. Currently, the greatest intrinsic resolution of any data is 12 bits, so at least the lowest 4 bits of data will be 0. If there is a hole in the data, the hole is represented by a 16 bit value equal to 0.

Use :WAVeform:BYTeorder (see [page 643](#)) to determine if the least significant byte or most significant byte is to be transferred first. The :BYTeorder command can be used to alter the transmit sequence to match the storage sequence of an integer in the programming language being used.

#### Data Format for Transfer - BYTE format

The BYTE format (see "[:WAVeform:FORMat](#)" on page 647 ) allows 8-bit access to the waveform data. If the data intrinsically has more than 8 bits of resolution (averaged data), the data is right-shifted (truncated) to fit into 8 bits. If there is a hole in the data, the hole is represented by a value of 0. The BYTE-formatted data transfers over the programming interface faster than ASCII or WORD-formatted data, because in ASCII format, as many as 13 bytes per point are transferred, in BYTE format one byte per point is transferred, and in WORD format two bytes per point are transferred.

The :WAVeform:BYTeorder command (see [page 643](#)) has no effect when the data format is BYTE.

#### Digital Channel Data (MSO models only)

The waveform record for digital channels is similar to that of analog channels. The main difference is that the data points represent either DIGital0,...,7 (POD1), DIGital8,...,15 (POD2), or any grouping of digital channels (BUS1 or BUS2).

For digital channels, :WAVeform:UNSIGNED (see [page 663](#)) must be set to ON.

#### Digital Channel POD Data Format

Data for digital channels is only available in groups of 8 bits (Pod1 = D0 - D7, Pod2 = D8 - D15). The bytes are organized as:

:WAVeform:SOURce	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
POD1	D7	D6	D5	D4	D3	D2	D1	D0
POD2	D15	D14	D13	D12	D11	D10	D9	D8

If the :WAVeform:FORMat is WORD (see [page 647](#)) is WORD, every other data byte will be 0. The setting of :WAVeform:BYTeorder (see [page 643](#)) controls which byte is 0.

If a digital channel is not displayed, its bit value in the pod data byte is not defined.

### Digital Channel BUS Data Format

Digital channel BUS definitions can include any or all of the digital channels. Therefore, data is always returned as 16-bit values. :BUS commands (see [page 197](#)) are used to select the digital channels for a bus.

### Reporting the Setup

The following is a sample response from the :WAVeform? query. In this case, the query was issued following a \*RST command.

```
:WAV:UNS 1;VIEW MAIN;BYT MSBF;FORM BYTE;POIN +1000;SOUR CHAN1;SOUR:SUBS

```

## :WAVeform:COUNT

**C** (see [page 798](#))

**Query Syntax** :WAVeform:COUNT?

The :WAVeform:COUNT? query returns the count used to acquire the current waveform. This may differ from current values if the unit has been stopped and its configuration modified. For all acquisition types except average, this value is 1.

**Return Format** <count\_argument><NL>

<count\_argument> ::= an integer from 1 to 65536 in NR1 format

## :WAVeform:DATA

**C** (see [page 798](#))

**Query Syntax** :WAVeform:DATA?

The :WAVeform:DATA query returns the binary block of sampled data points transmitted using the IEEE 488.2 arbitrary block data format. The binary data is formatted according to the settings of the :WAVeform:UNSIGNED, :WAVeform:BYTeorder, :WAVeform:FORMat, and :WAVeform:SOURce commands. The number of points returned is controlled by the :WAVeform:POINts command.

In BYTE or WORD waveform formats, these data values have special meaning:

- 0x00 or 0x0000 – Hole. Holes are locations where data has not yet been acquired.

Another situation where there can be zeros in the data, incorrectly, is when programming over telnet port 5024. Port 5024 provides a command prompt and is intended for ASCII transfers. Use telnet port 5025 instead.

- 0x01 or 0x0001 – Clipped low. These are locations where the waveform is clipped at the bottom of the oscilloscope display.
- 0xFF or 0xFFFF – Clipped high. These are locations where the waveform is clipped at the top of the oscilloscope display.

**Return Format** <binary block data><NL>

**Example Code**

```

' QUERY_WAVE_DATA - Outputs waveform data that is stored in a buffer.

' Query the oscilloscope for the waveform data.
myScope.WriteString ":WAV:DATA?"

' READ_WAVE_DATA - The wave data consists of two parts: the header,
' and the actual waveform data followed by a new line (NL) character.
' The query data has the following format:
'
' <header><waveform_data><NL>
'
' Where:

```

```

' <header> = #800001000 (This is an example header)
' The "#8" may be stripped off of the header and the remaining
' numbers are the size, in bytes, of the waveform data block. The
' size can vary depending on the number of points acquired for the
' waveform. You can then read that number of bytes from the
' oscilloscope and the terminating NL character.

## :WAVeform:FORMAT

**C** (see [page 798](#))

**Command Syntax** :WAVeform:FORMAT <value>

<value> ::= {WORD | BYTE | ASCii}

The :WAVeform:FORMAT command sets the data transmission mode for waveform data points. This command controls how the data is formatted when sent from the oscilloscope.

- ASCii formatted data converts the internal integer data values to real Y-axis values. Values are transferred as ASCii digits in floating point notation, separated by commas.
- ASCII formatted data is transferred ASCii text.
- WORD formatted data transfers 16-bit data as two bytes. The :WAVeform:BYTeorder command can be used to specify whether the upper or lower byte is transmitted first. The default (no command sent) is that the upper byte transmitted first.
- BYTE formatted data is transferred as 8-bit bytes.

When the :WAVeform:SOURce is the serial decode bus SBUS1, ASCii is the only waveform format allowed.

When the :WAVeform:SOURce is one of the digital channel buses (BUS1 or BUS2), ASCii and WORD are the only waveform formats allowed.

**Query Syntax** :WAVeform:FORMAT?

The :WAVeform:FORMAT query returns the current output format for the transfer of waveform data.

**Return Format** <value><NL>

<value> ::= {WORD | BYTE | ASC}

## :WAVEform:POINTS

**C** (see [page 798](#))

**Command Syntax**

```
:WAVEform:POINTS <# points>
<# points> ::= {100 | 250 | 500 | 1000 | <points mode>}
 if waveform points mode is NORMAl
<# points> ::= {100 | 250 | 500 | 1000 | 2000 | 5000 | 10000 | 20000
 | 50000 | 100000 | 200000 | 500000 | 1000000 | 2000000
 | 4000000 | 8000000 | <points mode>}
 if waveform points mode is MAXimum or RAW
<points mode> ::= {NORMAl | MAXimum | RAW}
```

### NOTE

The <points\_mode> option is deprecated. Use the :WAVEform:POINTS:MODE command instead.

The :WAVEform:POINTS command sets the number of waveform points to be transferred with the :WAVEform:DATA? query. This value represents the points contained in the waveform selected with the :WAVEform:SOURce command.

For the analog or digital sources, the records that can be transferred depend on the waveform points mode. The maximum number of points returned for math (function) waveforms is determined by the NORMAl waveform points mode. See the :WAVEform:POINTS:MODE command (see [page 650](#)) for more information.

Only data visible on the display will be returned.

When the :WAVEform:SOURce is the serial decode bus SBUS1, this command is ignored, and all available serial decode bus data is returned.

**Query Syntax**

:WAVEform:POINTS?

The :WAVEform:POINTS query returns the number of waveform points to be transferred when using the :WAVEform:DATA? query. Setting the points mode will affect what data is transferred (see the :WAVEform:POINTS:MODE command (see [page 650](#)) for more information).

When the :WAVEform:SOURce is the serial decode bus SBUS1, this query returns the number of messages that were decoded.

**Return Format**

```
<# points><NL>
<# points> ::= {100 | 250 | 500 | 1000 | <maximum # points>}
 if waveform points mode is NORMAl
<# points> ::= {100 | 250 | 500 | 1000 | 2000 | 5000 | 10000 | 20000
 | 50000 | 100000 | 200000 | 500000 | 1000000 | 2000000
 | 4000000 | 8000000 | <maximum # points>}
 if waveform points mode is MAXimum or RAW
```

**NOTE**

If a full screen of data is not displayed, the number of points returned will not be 1000 or an even divisor of it.

## :WAVEform:POINTS:MODE

**N** (see [page 798](#))

**Command Syntax**    `:WAVEform:POINTS:MODE <points_mode>`

`<points_mode> ::= {NORMAl | MAXimum | RAW}`

The :WAVEform:POINTS:MODE command sets the data record to be transferred with the :WAVEform:DATA? query.

For the analog or digital sources, there are two different records that can be transferred:

- The first is the raw acquisition record. The maximum number of points available in this record is returned by the :ACQuire:POINTS? query. The raw acquisition record can only be transferred when the oscilloscope is not running and can only be retrieved from the analog or digital sources.
- The second is referred to as the *measurement record* and is a 62,500-point (maximum) representation of the raw acquisition record. The measurement record can be retrieved from any source.

If the <points\_mode> is NORMAl the measurement record is retrieved.

If the <points\_mode> is RAW, the raw acquisition record is used. Under some conditions, such as when the oscilloscope is running, this data record is unavailable.

If the <points\_mode> is MAXimum, whichever record contains the maximum amount of points is used. Usually, this is the raw acquisition record. But, if the raw acquisition record is unavailable (for example, when the oscilloscope is running), the measurement record may have more data. If data is being retrieved as the oscilloscope is stopped and as the data displayed is changing, the data being retrieved can switch between the measurement and raw acquisition records.

### NOTE

If the :WAVEform:SOURce is not an analog or digital source, the only valid parameters for WAVEform:POINTS:MODE is NORMAl or MAXimum.

### Considerations for MAXimum or RAW data retrieval

- The instrument must be stopped (see the :STOP command (see [page 180](#)) or the :DIGItize command (see [page 159](#)) in the root subsystem) in order to return more than the *measurement record*.
- :TIMEbase:MODE must be set to MAIN.
- :ACQuire:TYPE must be set to NORMAl or HRESolution.
- MAXimum or RAW will allow up to 100,000 points to be returned. The number of points returned will vary as the instrument's configuration is changed. Use the :WAVEform:POINTS? MAXimum query to determine the maximum number of points that can be retrieved at the current settings.

**Query Syntax**    `:WAVeform:POINts:MODE?`

The `:WAVeform:POINts:MODE?` query returns the current points mode. Setting the points mode will affect what data is transferred. See the discussion above.

**Return Format**    `<points_mode><NL>`

```
<points_mode> ::= {NORMal | MAXimum | RAW}
```

## :WAVeform:SEGmented:COUNt

**N** (see [page 798](#))

**Query Syntax** :WAVeform:SEGmented:COUNt?

**NOTE** This command is available when the segmented memory option (Option SGM) is enabled.

The :WAVeform:SEGmented:COUNt query returns the number of memory segments in the acquired data. You can use the :WAVeform:SEGmented:COUNt? query while segments are being acquired (although :DIGitize blocks subsequent queries until the full segmented acquisition is complete).

The segmented memory acquisition mode is enabled with the :ACQuire:MODE command. The number of segments to acquire is set using the :ACQuire:SEGmented:COUNt command, and data is acquired using the :DIGITIZE, :SINGle, or :RUN commands.

**Return Format** <count> ::= an integer from 2 to 1000 in NR1 format (count set by :ACQuire:SEGmented:COUNt).

## :WAVeform:SEGmented:TTAG

**N** (see [page 798](#))

**Query Syntax** :WAVeform:SEGmented:TTAG?

**NOTE** This command is available when the segmented memory option (Option SGM) is enabled.

---

The :WAVeform:SEGmented:TTAG? query returns the time tag of the currently selected segmented memory index. The index is selected using the :ACQuire:SEGmented:INDex command.

**Return Format** <time\_tag> ::= in NR3 format

## :WAVeform:SOURce

**C** (see [page 798](#))

### Command Syntax

```
:WAVeform:SOURce <source>
<source> ::= {CHANnel<n> | FUNCtion | MATH | WMMemory<r> | SBUS1}
 for DSO models
<source> ::= {CHANnel<n> | POD{1 | 2} | BUS{1 | 2} | FUNCtion
 | MATH | WMMemory<r> | SBUS1}
 for MSO models
<n> ::= 1 to (# analog channels) in NR1 format
<r> ::= {1 | 2}
```

The :WAVeform:SOURce command selects the analog channel, function, digital pod, digital bus, reference waveform, or serial decode bus to be used as the source for the :WAVeform commands.

Function capabilities include add, subtract, multiply, and FFT (Fast Fourier Transform) operations.

When the :WAVeform:SOURce is the serial decode bus (SBUS1), ASCII is the only waveform format allowed, and the :WAVeform:DATA? query returns a string with timestamps and associated bus decode information.

With MSO oscilloscope models, you can choose a POD or BUS as the waveform source. There are some differences between POD and BUS when formatting and getting data from the oscilloscope:

- When POD1 or POD2 is selected as the waveform source, you can choose the BYTE, WORD, or ASCII formats (see "[:WAVeform:FORMAT](#)" on page 647).

When the WORD format is chosen, every other data byte will be 0. The setting of :WAVeform:BYTeorder controls which byte is 0.

When the ASCII format is chosen, the :WAVeform:DATA? query returns a string with unsigned decimal values separated by commas.

- When BUS1 or BUS2 is selected as the waveform source, you can choose the WORD or ASCII formats (but not BYTE because bus values are always returned as 16-bit values).

When the ASCII format is chosen, the :WAVeform:DATA? query returns a string with hexadecimal bus values, for example: 0x1938,0xff38,...

### Query Syntax

```
:WAVeform:SOURce?
```

The :WAVeform:SOURce? query returns the currently selected source for the WAVeform commands.

**NOTE**

MATH is an alias for FUNCtion. The :WAVeform:SOURce? Query returns FUNC if the source is FUNCtion or MATH.

---

Return Format	<pre>&lt;source&gt;&lt;NL&gt; &lt;source&gt; ::= {CHAN&lt;n&gt;   FUNC   WMEM&lt;r&gt;   SBUS1} for DSO models &lt;source&gt; ::= {CHAN&lt;n&gt;   POD{1   2}   BUS{1   2}   FUNC                  WMEM&lt;r&gt;   SBUS1} for MSO models &lt;n&gt; ::= 1 to (# analog channels) in NR1 format &lt;r&gt; ::= {1   2}</pre>

The :WAVeform:UNSIGNED command turns unsigned mode on or off for the currently selected waveform. Use the WAVeform:UNSIGNED command to control whether data values are sent as unsigned or signed integers. This command can be used to match the instrument's internal data type to the data type used by the programming language. This command has no effect if the data format is ASCII.

If :WAVeform:SOURce is set to POD1, POD2, BUS1, or BUS2, WAVeform:UNSIGNED must be set to ON.

**N** (see [page 798](#))

**Command Syntax**    `:WGEN:MODulation:NOISe <percent>`  
`<percent> ::= 0 to 100`

The :WGEN:MODulation:NOISe command adds noise to the currently selected signal. The sum of the amplitude between the original signal and injected noise is limited to the regular amplitude limit (for example, 5 Vpp in 1 MΩ), so the range for <percent> varies according to current amplitude.

Note that adding noise affects edge triggering on the waveform generator source as well as the waveform generator sync pulse output signal (which can be sent to TRIG OUT). This is because the trigger comparator is located after the noise source.

The :WGEN:MODulation:NOISe query returns the percent of added noise.

**Return Format**    `<percent><NL>`

`<impedance> ::= {ONEMeg | FIFTy}`

The :WGEN:OUTPut:LOAD command selects the expected output load impedance.

<r> ::= 1-2 in NR1 format

<string> ::= quoted ASCII string

### NOTE

Label strings are 10 characters or less, and may contain any commonly used ASCII characters. Labels with more than 10 characters are truncated to 10 characters. Lower case characters are converted to upper case.

The :WMEMory<r>:LABel? query returns the label associated with a particular reference waveform.

**Return Format** <string><NL>

<string> ::= quoted ASCII string

The :WMEMory<r>:YOFFset command sets the value that is represented at center screen for the selected reference waveform.

The range of legal values varies with the value set by the :WMEMory<r>:YRANGE or :WMEMory<r>:YScale commands. If you set the offset to a value outside of the legal range, the offset value is automatically set to the nearest legal value. Legal values are affected by the probe attenuation setting.

**Query Syntax**    `:WMEMory<r>:YOFFset?`

The :WMEMory<r>:YOFFset? query returns the current offset value for the selected reference waveform.

**Return Format**    `<offset><NL>`

**Discontinued Parameters** Some previous oscilloscope queries returned control setting values of OFF and ON. The InfiniiVision 2000 X-Series oscilloscopes only return the enumerated values 0 (for off) and 1 (for on).

**:CHANnel:ACTivity****O** (see [page 798](#))**Command Syntax** `:CHANnel:ACTivity`

The :CHANnel:ACTivity command clears the cumulative edge variables for the next activity query.

**NOTE** The :CHANnel:ACTivity command is an obsolete command provided for compatibility to previous oscilloscopes. Use the :ACTivity command (see [page 151](#)) instead.

---

**Query Syntax** `:CHANnel:ACTivity?`

The :CHANnel:ACTivity? query returns the active edges since the last clear, and returns the current logic levels.

**Return Format** `<edges>,<levels><NL>`

`<edges>` ::= presence of edges (32-bit integer in NR1 format).

`<levels>` ::= logical highs or lows (32-bit integer in NR1 format).

**NOTE** A bit equal to zero indicates that no edges were detected at the specified threshold since the last clear on that channel. Edges may have occurred that were not detected because of the threshold setting.

---

A bit equal to one indicates that edges have been detected at the specified threshold since the last clear on that channel.

## :CHANnel:LABel

**O** (see [page 798](#))

**Command Syntax** :CHANnel:LABel <source\_text><string>

<source\_text> ::= {CHANnel1 | CHANnel2 | DIGital<d>}

<d> ::= 0 to (# digital channels - 1) in NR1 format

<string> ::= quoted ASCII string

The :CHANnel:LABel command sets the source text to the string that follows. Setting a channel will also result in the name being added to the label list.

### NOTE

The short form of this command, TSTA, does not follow the defined Long Form to Short Form Truncation Rules (see [page 800](#)). The normal short form "TST" would be the same for both TSTArt and TSTOp, so sending TST for the TSTArt command produces an error.

## :MEASure:TVOLt

**O** (see [page 798](#))

**Query Syntax**

```
:MEASure:TVOLt? <value>, [<slope>]<occurrence>[,<source>]

<value> ::= the voltage level that the waveform must cross.

<slope> ::= direction of the waveform. A rising slope is indicated by
 a plus sign (+). A falling edge is indicated by a minus
 sign (-).

<occurrence> ::= the transition to be reported. If the occurrence
 number is one, the first crossing is reported. If
 the number is two, the second crossing is reported,
 etc.

<source> ::= {<digital channels> | CHANnel<n> | FUNCtion | MATH}

<digital channels> ::= {DIGital<d>} for the MSO models

<n> ::= 1 to (# analog channels) in NR1 format

<d> ::= 0 to (# digital channels - 1) in NR1 format
```

When the :MEASure:TVOLt? query is sent, the displayed signal is searched for the specified voltage level and transition. The time interval between the trigger event and this defined occurrence is returned as the response to the query.

The specified voltage can be negative or positive. To specify a negative voltage, use a minus sign (-). The sign of the slope selects a rising (+) or falling (-) edge. If no sign is specified for the slope, it is assumed to be the rising edge.

The magnitude of the occurrence defines the occurrence to be reported. For example, +3 returns the time for the third time the waveform crosses the specified voltage level in the positive direction. Once this voltage crossing is found, the oscilloscope reports the time at that crossing in seconds, with the trigger point (time zero) as the reference.

If the specified crossing cannot be found, the oscilloscope reports +9.9E+37. This value is returned if the waveform does not cross the specified voltage, or if the waveform does not cross the specified voltage for the specified number of times in the direction specified.

If the optional source parameter is specified, the current source is modified.

### NOTE

The :MEASure:TVOLt command is obsolete and is provided for backward compatibility to previous oscilloscopes. Use the :MEASure:TVALue command (see [page 372](#)).

The <filename> parameter is an MS-DOS compatible name of the file, a maximum of 254 characters long (including the path name, if used). The filename assumes the present working directory if a path does not precede the file name.

### NOTE

IEEE 488.2 defines data structures, commands, and common bit definitions for status reporting (for example, the Status Byte Register and the Standard Event Status Register). There are also instrument-defined structures and bits (for example, the Operation Status Event Register and the Overload Event Register).

An overview of the oscilloscope's status reporting structure is shown in the following block diagram. The status reporting structure allows monitoring specified events in the oscilloscope. The ability to monitor and report these events allows determination of such things as the status of an operation, the availability and reliability of the measured data, and more.

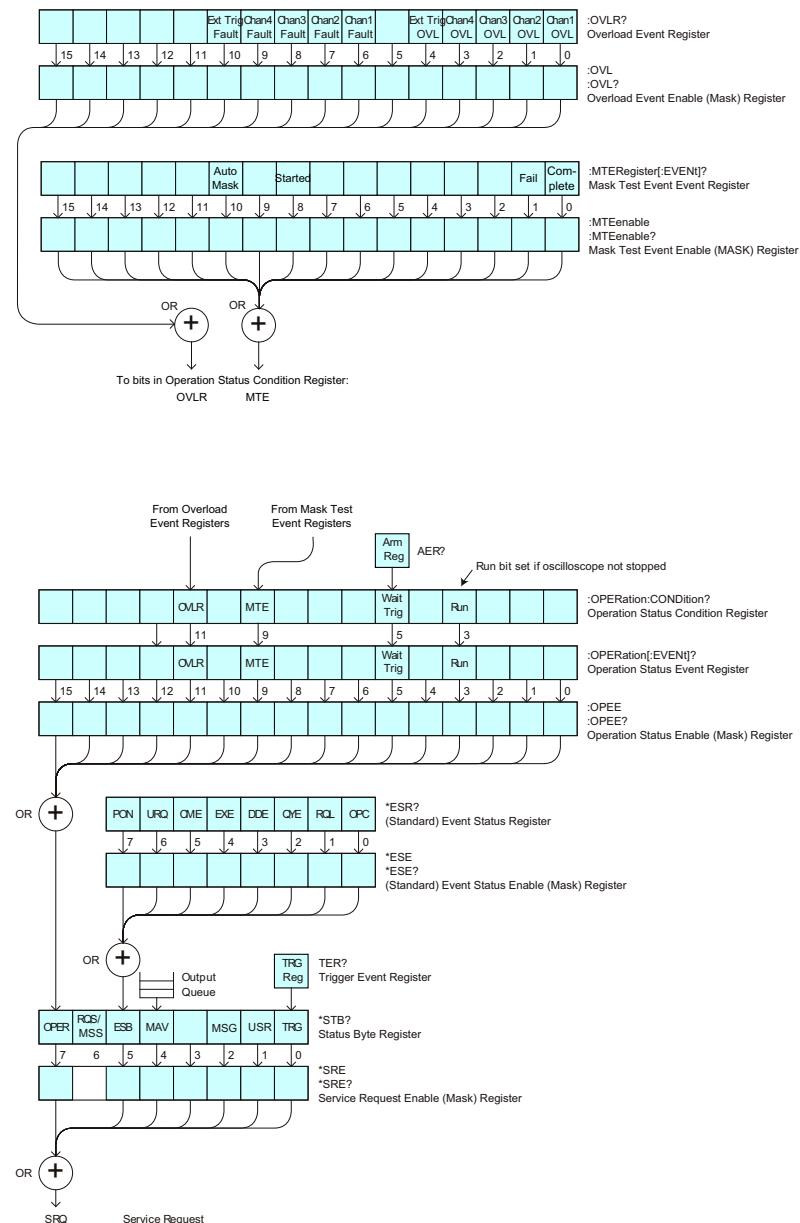

- To monitor an event, first clear the event; then, enable the event. All of the events are cleared when you initialize the instrument.
- To allow a service request (SRQ) interrupt to an external controller, enable at least one bit in the Status Byte Register (by setting, or unmasking, the bit in the Service Request Enable register).

The Status Byte Register, the Standard Event Status Register group, and the Output Queue are defined as the Standard Status Data Structure Model in IEEE 488.2-1987.

The bits in the status byte act as summary bits for the data structures residing behind them. In the case of queues, the summary bit is set if the queue is not empty. For registers, the summary bit is set if any enabled bit in the event register is set. The events are enabled with the corresponding event enable register. Events captured by an event register remain set until the register is read or cleared. Registers are read with their associated commands. The \*CLS command clears all event registers and all queues except the output queue. If you send \*CLS immediately after a program message terminator, the output queue is also cleared.

## Status Reporting Data Structures

The following figure shows how the status register bits are masked and logically OR'ed to generate service requests (SRQ) on particular events.

The status register bits are described in more detail in the following tables:

- **Table 48**
- **Table 46**

- [Table 53](#)
- [Table 54](#)
- [Table 56](#)
- [Table 51](#)

The status registers picture above shows how the different status reporting data structures work together. To make it possible for any of the Standard Event Status Register bits to generate a summary bit, the bits must be enabled. These bits are enabled by using the \*ESE common command to set the corresponding bit in the Standard Event Status Enable Register.

To generate a service request (SRQ) interrupt to an external controller, at least one bit in the Status Byte Register must be enabled. These bits are enabled by using the \*SRE common command to set the corresponding bit in the Service Request Enable Register. These enabled bits can then set RQS and MSS (bit 6) in the Status Byte Register.

## Status Byte Register (STB)

The Status Byte Register is the summary-level register in the status reporting structure. It contains summary bits that monitor activity in the other status registers and queues. The Status Byte Register is a live register. That is, its summary bits are set and cleared by the presence and absence of a summary bit from other event registers or queues.

If the Status Byte Register is to be used with the Service Request Enable Register to set bit 6 (RQS/MSS) and to generate an SRQ, at least one of the summary bits must be enabled, then set. Also, event bits in all other status registers must be specifically enabled to generate the summary bit that sets the associated summary bit in the Status Byte Register.

The Status Byte Register can be read using either the \*STB? Common Command or the programming interface serial poll command. Both commands return the decimal-weighted sum of all set bits in the register. The difference between the two methods is that the serial poll command reads bit 6 as the Request Service (RQS) bit and clears the bit which clears the SRQ interrupt. The \*STB? command reads bit 6 as the Master Summary Status (MSS) and does not clear the bit or have any affect on the SRQ interrupt. The value returned is the total bit weights of all of the bits that are set at the present time.

The use of bit 6 can be confusing. This bit was defined to cover all possible computer interfaces, including a computer that could not do a serial poll. The important point to remember is that, if you are using an SRQ interrupt to an external computer, the serial poll command clears bit 6. Clearing bit 6 allows the oscilloscope to generate another SRQ interrupt when another enabled event occurs.

No other bits in the Status Byte Register are cleared by either the \*STB? query or the serial poll, except the Message Available bit (bit 4). If there are no other messages in the Output Queue, bit 4 (MAV) can be cleared as a result of reading the response to the \*STB? command.

If bit 4 (weight = 16) and bit 5 (weight = 32) are set, the program prints the sum of the two weights. Since these bits were not enabled to generate an SRQ, bit 6 (weight = 64) is not set.

The following example uses the \*STB? query to read the contents of the oscilloscope's Status Byte Register.

```
myScope.WriteString "*STB?"
varQueryResult = myScope.ReadNumber
MsgBox "Status Byte Register, Read: 0x" + Hex(varQueryResult)
```

The next program prints 0xD1 and clears bit 6 (RQS) and bit 4 (MAV) of the Status Byte Register. The difference in the output value between this example and the previous one is the value of bit 6 (weight = 64). Bit 6 is set when the first enabled summary bit is set and is cleared when the Status Byte Register is read by the serial poll command.

**Example** The following example uses the resource session object's ReadSTB method to read the contents of the oscilloscope's Status Byte Register.

```
varQueryResult = myScope.IO.ReadSTB
MsgBox "Status Byte Register, Serial Poll: 0x" + Hex(varQueryResult)
```

**NOTE**

**Use Serial Polling to Read Status Byte Register.** Serial polling is the preferred method to read the contents of the Status Byte Register because it resets bit 6 and allows the next enabled event that occurs to generate a new SRQ interrupt.

---

## Service Request Enable Register (SRE)

Setting the Service Request Enable Register bits enable corresponding bits in the Status Byte Register. These enabled bits can then set RQS and MSS (bit 6) in the Status Byte Register.

Bits are set in the Service Request Enable Register using the \*SRE command and the bits that are set are read with the \*SRE? query.

**Example** The following example sets bit 4 (MAV) and bit 5 (ESB) in the Service Request Enable Register.

```
myScope.WriteString "*SRE " + CStr(CInt("&H30"))
```

This example uses the decimal parameter value of 48, the string returned by CStr(CInt("&H30")), to enable the oscilloscope to generate an SRQ interrupt under the following conditions:

- When one or more bytes in the Output Queue set bit 4 (MAV).
- When an enabled event in the Standard Event Status Register generates a summary bit that sets bit 5 (ESB).

## Trigger Event Register (TER)

This register sets the TRG bit in the status byte when a trigger event occurs.

The TER event register stays set until it is cleared by reading the register or using the \*CLS command. If your application needs to detect multiple triggers, the TER event register must be cleared after each one.

If you are using the Service Request to interrupt a program or controller operation, you must clear the event register each time the trigger bit is set.

## Output Queue

The output queue stores the oscilloscope-to-controller responses that are generated by certain instrument commands and queries. The output queue generates the Message Available summary bit when the output queue contains one or more bytes. This summary bit sets the MAV bit (bit 4) in the Status Byte Register.

When using the Keysight VISA COM library, the output queue may be read with the FormattedIO488 object's ReadString, ReadNumber, ReadList, or ReadIEEEBlock methods.

## Message Queue

The message queue contains the text of the last message written to the advisory line on the screen of the oscilloscope. The length of the oscilloscope's message queue is 1. Note that messages sent with the :SYSTem:DSP command do not set the MSG status bit in the Status Byte Register.

## (Standard) Event Status Register (ESR)

The (Standard) Event Status Register (ESR) monitors the following oscilloscope status events:

- PON - Power On
- URQ - User Request
- CME - Command Error
- EXE - Execution Error
- DDE - Device Dependent Error
- QYE - Query Error
- RQC - Request Control
- OPC - Operation Complete

When one of these events occur, the event sets the corresponding bit in the register. If the bits are enabled in the Standard Event Status Enable Register, the bits set in this register generate a summary bit to set bit 5 (ESB) in the Status Byte Register.

You can read the contents of the Standard Event Status Register and clear the register by sending the \*ESR? query. The value returned is the total bit weights of all of the bits that are set at the present time.

**Example** The following example uses the \*ESR query to read the contents of the Standard Event Status Register.

```
myScope.WriteString "*ESR?"
varQueryResult = myScope.ReadNumber
MsgBox "Standard Event Status Register: 0x" + Hex(varQueryResult)
```

If bit 4 (weight = 16) and bit 5 (weight = 32) are set, the program prints the sum of the two weights.

## (Standard) Event Status Enable Register (ESE)

To allow any of the (Standard) Event Status Register (ESR) bits to generate a summary bit, you must first enable that bit. Enable the bit by using the \*ESE (Event Status Enable) common command to set the corresponding bit in the (Standard) Event Status Enable Register (ESE).

Set bits are read with the \*ESE? query.

- Example** Suppose your application requires an interrupt whenever any type of error occurs. The error related bits in the (Standard) Event Status Register are bits 2 through 5 (hexadecimal value 0x3C). Therefore, you can enable any of these bits to generate the summary bit by sending:

```
myScope.WriteString "*ESE " + CStr(CInt("&H3C"))
```

Whenever an error occurs, it sets one of these bits in the (Standard) Event Status Register. Because all the error related bits are enabled, a summary bit is generated to set bit 5 (ESB) in the Status Byte Register.

If bit 5 (ESB) in the Status Byte Register is enabled (via the \*SRE command), an SRQ service request interrupt is sent to the controller PC.

### NOTE

**Disabled (Standard) Event Status Register bits respond but do not generate a summary bit.** (Standard) Event Status Register bits that are not enabled still respond to their corresponding conditions (that is, they are set if the corresponding event occurs). However, because they are not enabled, they do not generate a summary bit to the Status Byte Register.

## Error Queue

As errors are detected, they are placed in an error queue. This queue is first in, first out. If the error queue overflows, the last error in the queue is replaced with error 350, Queue overflow. Any time the queue overflows, the least recent errors remain in the queue, and the most recent error is discarded. The length of the oscilloscope's error queue is 30 (29 positions for the error messages, and 1 position for the Queue overflow message).

The error queue is read with the :SYSTem:ERRor? query. Executing this query reads and removes the oldest error from the head of the queue, which opens a position at the tail of the queue for a new error. When all the errors have been read from the queue, subsequent error queries return "0, No error".

The error queue is cleared when:

- the instrument is powered up,
- the instrument receives the \*CLS common command, or
- the last item is read from the error queue.

## Operation Status Event Register (:OPERegister[:EVENT])

The Operation Status Event Register register hosts these bits:

Name	Location	Description
RUN bit	bit 3	Is set whenever the instrument goes from a stop state to a single or running state.
WAIT TRIG bit	bit 5	Is set by the Trigger Armed Event Register and indicates that the trigger is armed.
MTE bit	bit 9	Comes from the Mask Test Event Registers.
OVLR bit	bit 11	Is set whenever a 50Ω input overload occurs.

If any of these bits are set, the OPER bit (bit 7) of the Status Byte Register is set. The Operation Status Event Register is read and cleared with the :OPERegister[:EVENT]? query. The register output is enabled or disabled using the mask value supplied with the OPEE command.

## Operation Status Condition Register (:OPERegister:CONDITION)

The Operation Status Condition Register register hosts these bits:

Name	Location	Description
RUN bit	bit 3	Is set whenever the instrument is not stopped.
WAIT TRIG bit	bit 5	Is set by the Trigger Armed Event Register and indicates that the trigger is armed.
MTE bit	bit 9	Comes from the Mask Test Event Registers.
OVLR bit	bit 11	Is set whenever a 50Ω input overload occurs.

The :OPERegister:CONDITION? query returns the value of the Operation Status Condition Register.

## Arm Event Register (AER)

This register sets bit 5 (Wait Trig bit) in the Operation Status Register and the OPER bit (bit 7) in the Status Byte Register when the instrument becomes armed.

The ARM event register stays set until it is cleared by reading the register with the AER? query or using the \*CLS command. If your application needs to detect multiple triggers, the ARM event register must be cleared after each one.

If you are using the Service Request to interrupt a program or controller operation when the trigger bit is set, then you must clear the event register after each time it has been set.

## Overload Event Register (:OVLRegister)

The Overload Event Register register hosts these bits:

Name	Location	Description
Channel 1 Fault	bit 6	Fault has occurred on Channel 1 input.
Channel 2 Fault	bit 7	Fault has occurred on Channel 2 input.
Channel 3 Fault	bit 8	Fault has occurred on Channel 3 input.
Channel 4 Fault	bit 9	Fault has occurred on Channel 4 input.
External Trigger Fault	bit 10	Fault has occurred on External Trigger input.

## Mask Test Event Event Register (:MTERegister[:EVENT])

The Mask Test Event Event Register register hosts these bits:

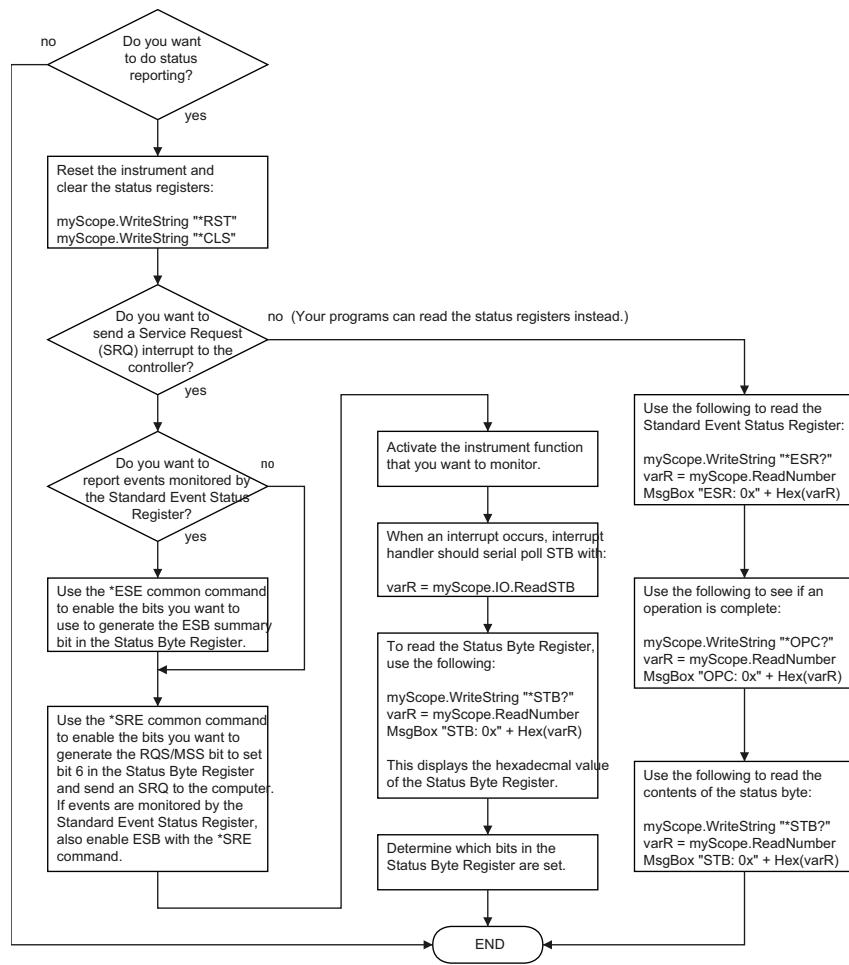

Name	Location	Description
Complete	bit 0	Is set when the mask test is complete.
Fail	bit 1	Is set when there is a mask test failure.
Started	bit 8	Is set when mask testing is started.
Auto Mask	bit 10	Is set when auto mask creation is completed.

The :MTERegister[:EVENT]? query returns the value of, and clears, the Mask Test Event Event Register.

## Clearing Registers and Queues

The \*CLS common command clears all event registers and all queues except the output queue. If \*CLS is sent immediately after a program message terminator, the output queue is also cleared.

# 36 Synchronizing Acquisitions

- Synchronization in the Programming Flow / 788
- Blocking Synchronization / 789
- Polling Synchronization With Timeout / 790
- Synchronizing with a Single-Shot Device Under Test (DUT) / 792
- Synchronization with an Averaging Acquisition / 794

When remotely controlling an oscilloscope with programming commands, it is often necessary to know when the oscilloscope has finished the previous operation and is ready for the next command. The most common example is when an acquisition is started using the :DIGitize, :RUN, or :SINGle commands. Before a measurement result can be queried, the acquisition must complete. Too often fixed delays are used to accomplish this wait, but fixed delays often use excessive time or the time may not be long enough. A better solution is to use synchronous commands and status to know when the oscilloscope is ready for the next request.

## Synchronization in the Programming Flow

Most remote programming follows these three general steps:

- 1 Set up the oscilloscope and device under test (see [page 788](#)).
- 2 Acquire a waveform (see [page 788](#)).
- 3 Retrieve results (see [page 788](#)).

### Set Up the Oscilloscope

Before making changes to the oscilloscope setup, it is best to make sure it is stopped using the :STOP command followed by the \*OPC? query.

#### NOTE

It is not necessary to use \*OPC?, hard coded waits, or status checking when setting up the oscilloscope. After the oscilloscope is configured, it is ready for an acquisition.

### Acquire a Waveform

When acquiring a waveform there are two possible methods used to wait for the acquisition to complete. These methods are blocking and polling. The table below details when each method should be chosen and why.

	Blocking Wait	Polling Wait
Use When	You know the oscilloscope <i>will</i> trigger based on the oscilloscope setup and device under test.	You know the oscilloscope <i>may or may not</i> trigger on the oscilloscope setup and device under test.
Advantages	No need for polling. Fastest method.	Remote interface will not timeout No need for device clear if no trigger.
Disadvantages	Remote interface may timeout. Device clear only way to get control of oscilloscope if there is no trigger.	Slower method. Requires polling loop. Requires known maximum wait time.
Implementation Details	See " <a href="#">Blocking Synchronization</a> " on page 789.	See " <a href="#">Polling Synchronization With Timeout</a> " on page 790.

### Retrieve Results

Once the acquisition is complete, it is safe to retrieve measurements and statistics.

## Blocking Synchronization

Use the :DIGitize command to start the acquisition. This blocks subsequent queries until the acquisition and processing is complete. For example:

## Polling Synchronization With Timeout

This example requires a timeout value so the operation can abort if an acquisition does not occur within the timeout period:

 Debug.Print "Timeout waiting for single-shot trigger."
End If

Exit Sub

End Sub
```

## Synchronizing with a Single-Shot Device Under Test (DUT)

The examples in ["Blocking Synchronization" on page 789](#) and ["Polling Synchronization With Timeout" on page 790](#) assume the DUT is continually running and therefore the oscilloscope will have more than one opportunity to trigger. With a single shot DUT, there is only one opportunity for the oscilloscope to trigger, so it is necessary for the oscilloscope to be armed and ready before the DUT is enabled.

### NOTE

The blocking :DIGitize command cannot be used for a single shot DUT because once the :DIGITIZE command is issued, the oscilloscope is blocked from any further commands until the acquisition is complete.

This example is the same ["Polling Synchronization With Timeout" on page 790](#) with the addition of checking for the armed event status.

```
' Synchronizing single-shot acquisition using polling.

' Now, look for RUN bit = stopped (acquisition complete).
Dim lngTimeout As Long ' Max millisecs to wait for single-shot.

## Synchronization with an Averaging Acquisition

When averaging, it is necessary to know when the average count has been reached. The :SINGle command does not average.

If it is known that a trigger will occur, a :DIGItize will acquire the complete number of averages, but if the number of averages is large, a timeout on the connection can occur.

The example below polls during the :DIGItize to prevent a timeout on the connection.

```
' Synchronizing in averaging acquisition mode.

# 37 More About Oscilloscope Commands

- Command Classifications / 798
- Valid Command/Query Strings / 799
- Query Return Values / 805
- Sequential vs. Overlapped Commands / 806

## Command Classifications

To help you use existing programs with your oscilloscope, or use current programs with the next generation of Keysight InfiniiVision oscilloscopes, commands are classified by the following categories:

- ["Core Commands"](#) on page 798
- ["Non-Core Commands"](#) on page 798
- ["Obsolete Commands"](#) on page 798

### C Core Commands

Core commands are a common set of commands that provide basic oscilloscope functionality on this oscilloscope and future Keysight InfiniiVision oscilloscopes. Core commands are unlikely to be modified in the future. If you restrict your programs to core commands, the programs should work across product offerings in the future, assuming appropriate programming methods are employed.

### N Non-Core Commands

Non-core commands are commands that provide specific features, but are not universal across all Keysight InfiniiVision oscilloscope models. Non-core commands may be modified or deleted in the future. With a command structure as complex as the one for your oscilloscope, some evolution over time is inevitable. Keysight's intent is to continue to expand command subsystems, such as the rich and evolving trigger feature set.

### O Obsolete Commands

Obsolete commands are older forms of commands that are provided to reduce customer rework for existing systems and programs. Generally, these commands are mapped onto some of the Core and Non-core commands, but may not strictly have the same behavior as the new command. None of the obsolete commands are guaranteed to remain functional in future products. New systems and programs should use the Core (and Non-core) commands. Obsolete commands are listed in:

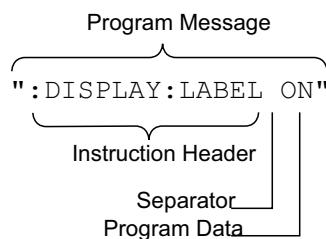

- [Chapter 33](#), “Obsolete and Discontinued Commands,” starting on page 711

# Valid Command/Query Strings

- "Program Message Syntax" on page 799
  - "Duplicate Mnemonics" on page 803
  - "Tree Traversal Rules and Multiple Commands" on page 803

## Program Message Syntax

To program the instrument remotely, you must understand the command format and structure expected by the instrument. The IEEE 488.2 syntax rules govern how individual elements such as headers, separators, program data, and terminators may be grouped together to form complete instructions. Syntax definitions are also given to show how query responses are formatted. The following figure shows the main syntactical parts of a typical program statement.

Instructions (both commands and queries) normally appear as a string embedded in a statement of your host language, such as Visual Basic or C/C++. The only time a parameter is not meant to be expressed as a string is when the instruction's syntax definition specifies <block data>, such as <learn string>. There are only a few instructions that use block data.

Program messages can have long or short form commands (and data in some cases – see ["Long Form to Short Form Truncation Rules"](#) on page 800), and upper and/or lower case ASCII characters may be used. (Query responses, however, are always returned in upper case.)

Instructions are composed of two main parts:

- The header, which specifies the command or query to be sent.
  - The program data, which provide additional information needed to clarify the meaning of the instruction.

**Instruction Header** The instruction header is one or more mnemonics separated by colons (:) that represent the operation to be performed by the instrument.

"`:DISPLAY:LABEL ON`" is a command. Queries are indicated by adding a question mark (?) to the end of the header, for example, "`:DISPLAY:LABEL?`". Many instructions can be used as either commands or queries, depending on whether or

not you have included the question mark. The command and query forms of an instruction usually have different program data. Many queries do not use any program data.

There are three types of headers:

- "Simple Command Headers" on page 801
- "Compound Command Headers" on page 801
- "Common Command Headers" on page 801

**White Space (Separator)** White space is used to separate the instruction header from the program data. If the instruction does not require any program data parameters, you do not need to include any white space. White space is defined as one or more space characters. ASCII defines a space to be character 32 (in decimal).

**Program Data** Program data are used to clarify the meaning of the command or query. They provide necessary information, such as whether a function should be on or off, or which waveform is to be displayed. Each instruction's syntax definition shows the program data, as well as the values they accept. "Program Data Syntax Rules" on page 802 describes all of the general rules about acceptable values.

When there is more than one data parameter, they are separated by commas(,). Spaces can be added around the commas to improve readability.

**Program Message Terminator** The program instructions within a data message are executed after the program message terminator is received. The terminator may be either an NL (New Line) character, an EOI (End-Or-Identify) asserted in the programming interface, or a combination of the two. Asserting the EOI sets the EOI control line low on the last byte of the data message. The NL character is an ASCII linefeed (decimal 10).

#### NOTE

**New Line Terminator Functions.** The NL (New Line) terminator has the same function as an EOS (End Of String) and EOT (End Of Text) terminator.

### Long Form to Short Form Truncation Rules

To get the short form of a command/keyword:

- When the command/keyword is longer than four characters, use the first four characters of the command/keyword unless the fourth character is a vowel; when the fourth character is a vowel, use the first three characters of the command/keyword.
- When the command/keyword is four or fewer characters, use all of the characters.

Long Form	Short form
RANGE	RANG
PATTERn	PATT

Long Form	Short form
TIMebase	TIM
DELay	DEL
TYPE	TYPE

In the oscilloscope programmer's documentation, the short form of a command is indicated by uppercase characters.

Programs written in long form are easily read and are almost self-documenting. The short form syntax conserves the amount of controller memory needed for program storage and reduces I/O activity.

### Simple Command Headers

Simple command headers contain a single mnemonic. :AUToscale and :DIGitize are examples of simple command headers typically used in the oscilloscope. The syntax is:

```
<program mnemonic><terminator>
```

Simple command headers must occur at the beginning of a program message; if not, they must be preceded by a colon.

When program data must be included with the simple command header (for example, :DIGITIZE CHANnel1), white space is added to separate the data from the header. The syntax is:

```
<program mnemonic><separator><program data><terminator>
```

### Compound Command Headers

Compound command headers are a combination of two or more program mnemonics. The first mnemonic selects the subsystem, and the second mnemonic selects the function within that subsystem. The mnemonics within the compound message are separated by colons. For example, to execute a single function within a subsystem:

```
:<subsystem>:<function><separator><program data><terminator>
```

For example, :CHANnel1:BWLIMIT ON

### Common Command Headers

Common command headers control IEEE 488.2 functions within the instrument (such as clear status). Their syntax is:

```
*<command header><terminator>
```

No space or separator is allowed between the asterisk (\*) and the command header. \*CLS is an example of a common command header.

## Program Data Syntax Rules

Program data is used to convey a parameter information related to the command header. At least one space must separate the command header or query header from the program data.

```
<program mnemonic><separator><data><terminator>
```

When a program mnemonic or query has multiple program data, a comma separates sequential program data.

```
<program mnemonic><separator><data>,<data><terminator>
```

For example, :MEASure:DELay CHANnel1,CHANnel2 has two program data: CHANnel1 and CHANnel2.

Two main types of program data are used in commands: character and numeric.

### Character Program Data

Character program data is used to convey parameter information as alpha or alphanumeric strings. For example, the :TIMEbase:MODE command can be set to normal, zoomed (delayed), XY, or ROLL. The character program data in this case may be MAIN, WINDOW, XY, or ROLL. The command :TIMEbase:MODE WINDOW sets the time base mode to zoomed.

The available mnemonics for character program data are always included with the command's syntax definition.

When sending commands, you may either the long form or short form (if one exists). Uppercase and lowercase letters may be mixed freely.

When receiving query responses, uppercase letters are used exclusively.

### Numeric Program Data

Some command headers require program data to be expressed numerically. For example, :TIMEbase:RANGE requires the desired full scale range to be expressed numerically.

For numeric program data, you have the option of using exponential notation or using suffix multipliers to indicate the numeric value. The following numbers are all equal:

```
28 = 0.28E2 = 280e-1 = 28000m = 0.028K = 28e-3K.
```

When a syntax definition specifies that a number is an integer, that means that the number should be whole. Any fractional part will be ignored, truncating the number. Numeric data parameters accept fractional values are called real numbers.

All numbers must be strings of ASCII characters. Thus, when sending the number 9, you would send a byte representing the ASCII code for the character 9 (which is 57). A three-digit number like 102 would take up three bytes (ASCII codes 49, 48, and 50). This is handled automatically when you include the entire instruction in a string.

## Duplicate Mnemonics

Identical function mnemonics can be used in more than one subsystem. For example, the function mnemonic RANGe may be used to change the vertical range or to change the horizontal range:

```
:CHANnel1:RANGE .4
```

Sets the vertical range of channel 1 to 0.4 volts full scale.

```
:TIMEbase:RANGE 1
```

Sets the horizontal time base to 1 second full scale.

:CHANnel1 and :TIMEbase are subsystem selectors and determine which range is being modified.

## Tree Traversal Rules and Multiple Commands

Command headers are created by traversing down the command tree. A legal command header would be :TIMEbase:RANGe. This is referred to as a *compound header*. A compound header is a header made of two or more mnemonics separated by colons. The mnemonic created contains no spaces.

The following rules apply to traversing the tree:

- A leading colon (<NL> or EOI true on the last byte) places the parser at the root of the command tree. A leading colon is a colon that is the first character of a program header. Executing a subsystem command lets you access that subsystem until a leading colon or a program message terminator (<NL>) or EOI true is found.
- In the command tree, use the last mnemonic in the compound header as the reference point (for example, RANGe). Then find the last colon above that mnemonic (TIMEbase:). That is the point where the parser resides. Any command below that point can be sent within the current program message without sending the mnemonics which appear above them (for example, POSition).

The output statements in the examples are written using the Keysight VISA COM library in Visual Basic. The quoted string is placed on the bus, followed by a carriage return and linefeed (CRLF).

To execute more than one function within the same subsystem, separate the functions with a semicolon (;):

```
:<subsystem>:<function><separator><data>;<function><separator><data><terminator>
```

For example:

```
myScope.WriteString ":TIMEbase:RANGE 0.5;POSITION 0"
```

**NOTE**

The colon between TIMebase and RANGe is necessary because TIMebase:RANGE is a compound command. The semicolon between the RANGe command and the POSition command is the required program message unit separator. The POSition command does not need TIMebase preceding it because the TIMebase:RANGE command sets the parser to the TIMebase node in the tree.

**Example 2:**  
**Program Message Terminator Sets Parser Back to Root**

```
myScope.WriteString ":TIMebase:REFerence CENTER;POSITION 0.00001"
```

or

```
myScope.WriteString ":TIMebase:REFerence CENTER"
myScope.WriteString ":TIMebase:POSITION 0.00001"
```

**NOTE**

In the first line of example 2, the subsystem selector is implied for the POSITION command in the compound command. The POSITION command must be in the same program message as the REFerence command because the program message terminator places the parser back at the root of the command tree.

A second way to send these commands is by placing TIMebase: before the POSITION command as shown in the second part of example 2. The space after POSITION is required.

**Example 3:**  
**Selecting Multiple Subsystems**

You can send multiple program commands and program queries for different subsystems on the same line by separating each command with a semicolon. The colon following the semicolon enables you to enter a new subsystem. For example:

```
<program mnemonic><data>;<program mnemonic><data><terminator>
```

For example:

```
myScope.WriteString ":TIMebase:REFerence CENTER;:DISPlay:VECTors ON"
```

**NOTE**

The leading colon before DISPlay:VECTors ON tells the parser to go back to the root of the command tree. The parser can then see the DISPlay:VECTors ON command. The space between REFerence and CENter is required; so is the space between VECTors and ON.

Multiple commands may be any combination of compound and simple commands.

## Query Return Values

Command headers immediately followed by a question mark (?) are queries. Queries are used to get results of measurements made by the instrument or to find out how the instrument is currently configured.

After receiving a query, the instrument interrogates the requested function and places the answer in its output queue. The answer remains in the output queue until it is read or another command is issued.

When read, the answer is transmitted across the bus to the designated listener (typically a controller). For example, the query :TIMEbase:RANGE? places the current time base setting in the output queue. When using the Keysight VISA COM library in Visual Basic, the controller statements:

```
Dim strQueryResult As String
myScope.WriteString ":TIMEbase:RANGE?"
strQueryResult = myScope.ReadString
```

pass the value across the bus to the controller and place it in the variable strQueryResult.

### NOTE

**Read Query Results Before Sending Another Command.** Sending another command or query before reading the result of a query clears the output buffer (the current response) and places a Query INTERRUPTED error in the error queue.

### Infinity Representation

The representation of infinity is +9.9E+37. This is also the value returned when a measurement cannot be made.

## Sequential vs. Overlapped Commands

IEEE 488.2 makes the distinction between sequential and overlapped commands:

- *Sequential commands* finish their task before the execution of the next command starts.  
Most oscilloscope commands are sequential.
- *Overlapped commands* run concurrently. Commands following an overlapped command may be started before the overlapped command is completed.

Some oscilloscope commands are overlapped. For example, the oscilloscope's save and recall commands are overlapped as well as some commands that perform analysis.

With overlapped commands, you can use the \*OPC? query to prevent any more commands from being executed until the overlapped command is complete. This may be necessary when a command that follows an overlapped command interferes with the overlapped command's processing or analysis. For example:

```
:WMMemory1:SAVE CHAN1;*OPC?;:WMMemory2:SAVE CHAN2
```

You can also use the \*ESR? query to look at the OPC bit (bit 0) in the Standard Event Status Register to determine when an operation is complete.

## VISA COM Example in C#

To compile and run this example in Microsoft Visual Studio 2008:

- 1** Open Visual Studio.
- 2** Create a new Visual C#, Windows, Console Application project.
- 3** Cut-and-paste the code that follows into the C# source file.
- 4** Edit the program to use the VISA address of your oscilloscope.
- 5** Add a reference to the VISA COM 5.5 Type Library:
  - a** Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment.
  - b** Choose **Add Reference...**.
  - c** In the Add Reference dialog, select the **COM** tab.
  - d** Select **VISA COM 5.5 Type Library**; then click **OK**.
- 6** Build and run the program.

For more information, see the VISA COM Help that comes with Keysight IO Libraries Suite 16.

## VISA COM Example in Visual Basic .NET

To compile and run this example in Microsoft Visual Studio 2008:

- 1 Open Visual Studio.
- 2 Create a new Visual Basic, Windows, Console Application project.
- 3 Cut-and-paste the code that follows into the C# source file.
- 4 Edit the program to use the VISA address of your oscilloscope.
- 5 Add a reference to the VISA COM 5.5 Type Library:
  - a Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment.
  - b Choose **Add Reference....**
  - c In the Add Reference dialog, select the **COM** tab.
  - d Select **VISA COM 5.5 Type Library**; then click **OK**.
  - e Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment and choose **Properties**; then, select "InfiniiVision.VisaComInstrumentApp" as the **Startup object**.
- 6 Build and run the program.

## VISA COM Example in Python

You can use the Python programming language with the "comtypes" package to control Keysight oscilloscopes.

The Python language and "comtypes" package can be downloaded from the web at <http://www.python.org/> and <http://starship.python.net/crew/theller/comtypes/>, respectively.

To run this example with Python and "comtypes":

- 1** Cut-and-paste the code that follows into a file named "example.py".
- 2** Edit the program to use the VISA address of your oscilloscope.
- 3** If "python.exe" can be found via your PATH environment variable, open a Command Prompt window; then, change to the folder that contains the "example.py" file, and enter:

```
python example.py
```

```

## VISA Example in Visual Basic

To run this example in Visual Basic for Applications:

- 1** Start the application that provides Visual Basic for Applications (for example, Microsoft Excel).
- 2** Press ALT+F11 to launch the Visual Basic editor.
- 3** Add the visa32.bas file to your project:
  - a** Choose **File > Import File....**
  - b** Navigate to the header file, visa32.bas (installed with Keysight IO Libraries Suite and found in the Program Files\IVI Foundation\VISA\WinNT\include), select it, and click **Open**.
- 4** Choose **Insert > Module**.
- 5** Cut-and-paste the code that follows into the editor.
- 6** Edit the program to use the VISA address of your oscilloscope, and save the changes.
- 7** Run the program.

## VISA Example in C#

To compile and run this example in Microsoft Visual Studio 2008:

- 1** Open Visual Studio.
  - 2** Create a new Visual C#, Windows, Console Application project.
  - 3** Cut-and-paste the code that follows into the C# source file.
  - 4** Edit the program to use the VISA address of your oscilloscope.
  - 5** Add Keysight's VISA header file to your project:
    - a** Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment.
    - b** Click **Add** and then click **Add Existing Item...**
    - c** Navigate to the header file, visa32.cs (installed with Keysight IO Libraries Suite and found in the Program Files\IVI Foundation\VISA\WinNT\include directory), select it, but *do not click the Open button*.
    - d** Click the down arrow to the right of the **Add** button, and choose **Add as Link**.
- You should now see the file underneath your project in the Solution Explorer. It will have a little arrow icon in its lower left corner, indicating that it is a link.
- 6** Build and run the program.

## VISA Example in Python

You can use the Python programming language with the PyVISA package to control Keysight oscilloscopes.

The Python language and PyVISA package can be downloaded from the web at <http://www.python.org/> and <http://pyvisa.sourceforge.net/>, respectively.

To run this example with Python and PyVISA:

- 1 Cut-and-paste the code that follows into a file named "example.py".
- 2 Edit the program to use the VISA address of your oscilloscope.
- 3 If "python.exe" can be found via your PATH environment variable, open a Command Prompt window; then, change to the folder that contains the "example.py" file, and enter:

```

python example.py

This program illustrates a few commonly-used programming
features of your Keysight oscilloscope.

## SICL Example in Visual Basic

To run this example in Visual Basic for Applications:

- 1 Start the application that provides Visual Basic for Applications (for example, Microsoft Excel).
- 2 Press ALT+F11 to launch the Visual Basic editor.
- 3 Add the sicl32.bas file to your project:
  - a Choose **File > Import File....**
  - b Navigate to the header file, sicl32.bas (installed with Keysight IO Libraries Suite and found in the Program Files\Agilent\IO Libraries Suite\include directory), select it, and click **Open**.
- 4 Choose **Insert > Module**.
- 5 Cut-and-paste the code that follows into the editor.
- 6 Edit the program to use the SICL address of your oscilloscope, and save the changes.
- 7 Run the program.

## SCPI.NET Examples

These programming examples show how to use the SCPI.NET drivers that come with Keysight's free Command Expert software.

While you can write code manually using SCPI.NET drivers (as described in this section), you can also use the Command Expert software to:

- Connect to instruments and control them interactively using SCPI command sets.
- Quickly prototype and test command sequences.
- Generate C#, VB.NET, or C/C++ code for command sequences.
- Find, download, and install SCPI command sets.
- Browse command trees, search for commands, and view command descriptions.

The Command Expert suite also comes with Add-ons for easy instrument control and measurement data retrieval in NI LabVIEW, Microsoft Excel, Keysight VEE, and Keysight SystemVue.

For more information on Keysight Command Expert, and to download the software, see: <http://www.keysight.com/find/commandexpert>

### SCPI.NET Example in C#

To compile and run this example in Microsoft Visual Studio 2008:

- 1 Install the Keysight Command Expert software and the command set for the oscilloscope.
- 2 Open Visual Studio.
- 3 Create a new Visual C#, Windows, Console Application project.
- 4 Cut-and-paste the code that follows into the C# source file.
- 5 Edit the program to use the address of your oscilloscope.
- 6 Add a reference to the SCPI.NET driver:
  - a Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment.
  - b Choose **Add Reference....**
  - c In the Add Reference dialog, select the **Browse** tab, and navigate to the ScpiNetDrivers folder.

- Windows XP: C:\Documents and Settings\All Users\Agilent\Command Expert\ScpiNetDrivers
  - Windows 7: C:\ProgramData\Agilent\Command Expert\ScpiNetDrivers
- d** Select the .dll file for your oscilloscope, for example **AgInfiniiVision2000X\_01\_20.dll**; then, click **OK**.

**7** Build and run the program.

For more information, see the SCPI.NET driver help that comes with Keysight Command Expert.

## SCPI.NET Example in Visual Basic .NET

To compile and run this example in Microsoft Visual Studio 2008:

- 1** Install the Keysight Command Expert software and the command set for the oscilloscope.
- 2** Open Visual Studio.
- 3** Create a new Visual Basic, Windows, Console Application project.
- 4** Cut-and-paste the code that follows into the Visual Basic .NET source file.

- 5** Edit the program to use the VISA address of your oscilloscope.
- 6** Add a reference to the SCPI.NET 3.0 driver:
  - a** Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment.
  - b** Choose **Add Reference...**.
  - c** In the Add Reference dialog, select the **Browse** tab, and navigate to the ScpiNetDrivers folder.
    - Windows XP: C:\Documents and Settings\All Users\Agilent\Command Expert\ScpiNetDrivers
    - Windows 7: C:\ProgramData\Agilent\Command Expert\ScpiNetDrivers
  - d** Select the .dll file for your oscilloscope, for example **AgInfiniiVision2000X\_01\_20.dll**; then, click **OK**.
  - e** Right-click the project you wish to modify (not the solution) in the Solution Explorer window of the Microsoft Visual Studio environment and choose **Properties**; then, select "InfiniiVision.ScpiNetInstrumentApp" as the **Startup object**.
- 7** Build and run the program.

For more information, see the SCPI.NET driver help that comes with Keysight Command Expert.

## SCPI.NET Example in IronPython

You can also control Keysight oscilloscopes using the SCPI.NET library and Python programming language on the .NET platform using:

- IronPython (<http://ironpython.codeplex.com/>) which is an implementation of the Python programming language running under .NET.

To run this example with IronPython:

- 1 Install the Keysight Command Expert software and the command set for the oscilloscope.
- 2 Cut-and-paste the code that follows into a file named "example.py".
- 3 Edit the program to use the address of your oscilloscope.
- 4 If the IronPython "ipy.exe" can be found via your PATH environment variable, open a Command Prompt window; then, change to the folder that contains the "example.py" file, and enter:

```

ipy example.py
